[4489] GAM46 precursor RNA folds onto itself, forming GAM46 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[4490] Nucleotide sequence of GAM46 precursor RNA, designated SEQ-ID: 41, and a schematic representation of a predicted secondary folding of GAM46 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[4491] An enzyme complex designated DICER COMPLEX, `dices` the GAM46 folded precursor RNA into GAM46 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising

an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM46 RNA is designated SEQ ID:364, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[4492] GAM46 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM46 target RNA, herein designated GAM TARGET RNA. GAM46 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4493] GAM46 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM46 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM46 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM46 RNA may have a different number of target binding sites in untranslated regions of a GAM46 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4494] The complementary binding of GAM46 RNA, herein designated GAM RNA, to target binding sites on GAM46 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM46 target RNA into GAM46 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4495] It is appreciated that GAM46 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM46 target genes. The mRNA of each one of this plurality of GAM46 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM46 RNA, herein designated GAM RNA, and which when bound by

GAM46 RNA causes inhibition of translation of respective one or more GAM46 target proteins.

[4496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM46 gene, herein designated GAM GENE, on one or more GAM46 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4497] It is appreciated that specific functions and accordingly utilities of GAM46 correlate with, and may be deduced from, the identity of the target genes which GAM46 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4498]

[4499]

[4500] FLJ23186 (Accession NM_024616.1) is a GAM46 target gene, herein designated TARGET GENE. FLJ23186 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23186 BINDING SITE, designated SEQ ID:5875, to the nucleotide sequence of GAM46 RNA, herein designated GAM RNA, also designated SEQ ID:364.

[4501] A function of GAM46 is therefore inhibition of FLJ23186 (Accession NM_024616.1) . Accordingly, utilities of GAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23186.

[4502]

[4503] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 47 (GAM47), which modulates expression of respective target genes thereof, the function and utility of which target

genes is known in the art.

[4504] GAM47 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM47 was detected is described hereinabove with reference to Figs. 8-15.

[4505] GAM47 gene, herein designated GAM GENE, and GAM47 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[4506] GAM47 gene encodes a GAM47 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM47 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM47 precursor RNA is designated SEQ ID:113, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:113 is located at position 149681013 relative to chromosome 4.

[4507] GAM47 precursor RNA folds onto itself, forming GAM47 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4508] GAM47 precursor RNA folds onto itself, forming GAM47 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[4509] Nucleotide sequence of GAM47 precursor RNA, designated SEQ-ID: 113, and a schematic representation of a predicted secondary folding of GAM47 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[4510] An enzyme complex designated DICER COMPLEX, `dices` the GAM47 folded precursor RNA into GAM47 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising

an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM47 RNA is designated SEQ ID:269, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[4511] GAM47 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM47 target RNA, herein designated GAM TARGET RNA. GAM47 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[4512] GAM47 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM47 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM47 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM47 RNA may have a different number of target binding sites in untranslated regions of a GAM47 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[4513] The complementary binding of GAM47 RNA, herein designated GAM RNA, to target binding sites on GAM47 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM47 target RNA into GAM47 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4514] It is appreciated that GAM47 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM47 target genes. The mRNA of each one of this plurality of GAM47 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM47 RNA, herein designated GAM RNA, and which when bound by

GAM47 RNA causes inhibition of translation of respective one or more GAM47 target proteins.

[4515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM47 gene, herein designated GAM GENE, on one or more GAM47 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4516] It is appreciated that specific functions and accordingly utilities of GAM47 correlate with, and may be deduced from, the identity of the target genes which GAM47 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4517]

[4518]

[4519] Atp-binding cassette, sub-family a (abc1), member 6 (ABCA6, Accession NP_758854.1) is a GAM47 target gene, herein designated TARGET GENE. ABCA6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCA6 BINDING SITE, designated SEQ ID:8771, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4520] A function of GAM47 is therefore inhibition of Atp-binding cassette, sub-family a (abc1), member 6 (ABCA6, Accession NP_758854.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA6.

[4521] Atp-binding cassette, sub-family b (mdr/tap), member 9 (ABCB9, Accession NP_062571.1) is another GAM47 target gene, herein designated TARGET GENE. ABCB9 BINDING SITE is a target binding site found in the 3` untranslated

region of multiple transcripts of mRNA encoded by ABCB9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCB9 BINDING SITE, designated SEQ ID:9595, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4522] Another function of GAM47 is therefore inhibition of Atp-binding cassette, sub-family b (mdr/tap), member 9 (ABCB9, Accession NP_062571.1), a gene which ATP binding cassette transporter B9; has transmembrane domain, nucleotide- binding domain with Walker motifs. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB9.

[4523] The function of ABCB9 has been established by previous studies. For background information on the ATP- binding cassette (ABC) family of transporter proteins, see ABCA4 (OMIM Ref. No. 601691). In addition to the 'full' ABC transporters with 2 transmembrane domains and 2 nucleotide- binding domains, there are 'half' proteins that contain only 1 of each domain (e.g., ABCB1; 171050). Full transporters are usually found in the plasma membrane,

whereas half transporters are found in subcellular organelles. By searching an EST database and screening a T-lymphoblast cDNA library, Zhang et al. (2000) obtained a cDNA encoding ABCB9. Sequence analysis predicted that the 766- amino acid ABCB9 protein has 10 potential N-terminal transmembrane segments. ABCB9 shares 94% identity with the rodent sequences and is approximately 39% identical to 2 human endoplasmic reticulum half transporters, TAP1 (ABCB2; 170260) and TAP2 (ABCB3; 170261). RT- PCR and genomic sequence analysis established the existence of a splice variant with a 129- bp deletion expressed in testis and brain. Northern blot analysis detected low expression of a 3.7- kb transcript in most tissues tested, with an additional 2.2- kb transcript detected in tissues with relatively high expression, such as testis. Western blot analysis showed expression of a 72-kD nonglycosylated protein, significantly smaller than the predicted mass of 84.5 kD, that was enriched in lysosomes. Immunofluorescence microscopy demonstrated colocalization of ABCB9 with the lysosomal proteins LAMP1 (OMIM Ref. No. 153330) and LAMP2 (OMIM Ref. No. 309060). Immunohistochemical analysis detected ABCB9 expression in Sertoli cells of rodent seminiferous

tubules. Allikmets et al. (1996) mapped an EST corresponding to the ABCB9 gene to 12q24.

[4524]

[4525] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4526] Allikmets, R.; Gerrard, B.; Hutchinson, A.; Dean, M. : Characterization of the human ABC superfamily: isolation and mapping of 21 new genes using the expressed sequence tags database. Hum. Molec. Genet. 5: 1649- 1655, 1996. ; and

[4527] Zhang, F.; Zhang, W.; Liu, L.; Fisher, C. L.; Hui, D.; Childs, S.; Dorovini- Zis, K.; Ling, V. : Characterization of ABCB9, an ATP binding cassette protein associated with lysosomes. J.

[4528] Further studies establishing the function and utilities of ABCB9 are found in John Hopkins OMIM database record ID 605453, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atp-binding cassette, sub-family b (mdr/tap), member 9 (ABCB9, Accession NP_062570.1) is another GAM47 target gene, herein designated TARGET GENE. ABCB9 BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by ABCB9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCB9 BINDING SITE, designated SEQ ID:9595, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4529] Another function of GAM47 is therefore inhibition of Atp-binding cassette, sub-family b (mdr/tap), member 9 (ABCB9, Accession NP_062570.1), a gene which ATP binding cassette transporter B9; has transmembrane domain, nucleotide- binding domain with Walker motifs. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB9.

[4530] The function of ABCB9 has been established by previous studies. For background information on the ATP- binding cassette (ABC) family of transporter proteins, see ABCA4 (OMIM Ref. No. 601691). In addition to the 'full' ABC transporters with 2 transmembrane domains and 2 nucleotide- binding domains, there are 'half' proteins that contain only 1 of each domain (e.g., ABCB1; 171050). Full transporters are usually found in the plasma membrane,

whereas half transporters are found in subcellular organelles. By searching an EST database and screening a T-lymphoblast cDNA library, Zhang et al. (2000) obtained a cDNA encoding ABCB9. Sequence analysis predicted that the 766- amino acid ABCB9 protein has 10 potential N-terminal transmembrane segments. ABCB9 shares 94% identity with the rodent sequences and is approximately 39% identical to 2 human endoplasmic reticulum half transporters, TAP1 (ABCB2; 170260) and TAP2 (ABCB3; 170261). RT- PCR and genomic sequence analysis established the existence of a splice variant with a 129- bp deletion expressed in testis and brain. Northern blot analysis detected low expression of a 3.7- kb transcript in most tissues tested, with an additional 2.2- kb transcript detected in tissues with relatively high expression, such as testis. Western blot analysis showed expression of a 72-kD nonglycosylated protein, significantly smaller than the predicted mass of 84.5 kD, that was enriched in lysosomes. Immunofluorescence microscopy demonstrated colocalization of ABCB9 with the lysosomal proteins LAMP1 (OMIM Ref. No. 153330) and LAMP2 (OMIM Ref. No. 309060). Immunohistochemical analysis detected ABCB9 expression in Sertoli cells of rodent seminiferous

tubules. Allikmets et al. (1996) mapped an EST corresponding to the ABCB9 gene to 12q24.

[4531]

[4532] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4533] Allikmets, R.; Gerrard, B.; Hutchinson, A.; Dean, M. : Characterization of the human ABC superfamily: isolation and mapping of 21 new genes using the expressed sequence tags database. Hum. Molec. Genet. 5: 1649- 1655, 1996. ; and

[4534] Zhang, F.; Zhang, W.; Liu, L.; Fisher, C. L.; Hui, D.; Childs, S.; Dorovini- Zis, K.; Ling, V. : Characterization of ABCB9, an ATP binding cassette protein associated with lysosomes. J.

[4535] Further studies establishing the function and utilities of ABCB9 are found in John Hopkins OMIM database record ID 605453, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atp-binding cassette, sub-family d (ald), member 2 (ABCD2, Accession NP_005155.1) is another GAM47 target gene, herein designated TARGET GENE. ABCD2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA

encoded by ABCD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCD2 BINDING SITE, designated SEQ ID:2296, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4536] Another function of GAM47 is therefore inhibition of Atp-binding cassette, sub-family d (ald), member 2 (ABCD2, Accession NP_005155.1), a gene which probable transporter. and therefore may be associated with Adrenoleukodystrophy. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Adrenoleukodystrophy, and of other diseases and clinical conditions associated with ABCD2.

[4537] The function of ABCD2 has been established by previous studies. Lombard- Platet et al. (1996) described the cloning and characterization of a mouse Ald- related gene, symbolized Aldr by them, that codes for a 741-amino acid protein sharing the same half- ABC transporter structure and 66% amino acid identity with the protein that is mutant in X- linked adrenoleukodystrophy (ALD; 300100). PMP70 (OMIM Ref. No. 170995), another half- ABC transporter in the peroxisomal membrane pro-

tein, had 38% sequence identity to the mouse Aldr protein. Lombard- Platet et al. (1996) showed that the mouse Aldr protein is associated with peroxisomes. The mouse Ald and Aldr genes show overlapping but distinctive expression patterns. Interestingly, at least in mouse, Aldr is expressed at high levels in brain and adrenal, 2 organs with major involvement in adrenoleukodystrophy. Using oligonucleotide primers designed from the mouse sequence, the authors PCR- amplified 2 overlapping fragments of an 866- bp segment from human genomic DNA. This segment from the human ALDR ortholog shares 90% amino acid identity with the mouse protein. Lombard-Platet et al. (1996) speculated that the human gene may be a candidate for a modifier gene that accounts for some of the extreme phenotypic variability of ALD. The human ALDR gene was also a candidate for 1 of the complementation groups of Zellweger syndrome (see OMIM Ref. No. 214100), a genetically heterogeneous disorder of peroxisomal biogenesis. By isotopic in situ hybridization, Savary et al. (1997) mapped the ALDR gene to 12q11- q12 and its murine homolog to a region of homology of synteny on mouse chromosome 15. The mapping to chromosome 12 was confirmed by PCR analysis of a panel of whole

genome radiation hybrids.

[4538]

[4539] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4540] Lombard- Platet, G.; Savary, S.; Sarde, C.- O.; Mandel, J.- L.; Chimini, G. : A close relative of the adrenoleukodystro- phy (ALD) gene codes for a peroxisomal protein with a specific expression pattern. Proc. Nat. Acad. Sci. 93: 1265- 1269, 1996. ; and

[4541] Savary, S.; Troffer- Charlier, N.; Gyapay, G.; Mattei, M.- G.; Chimini, G. : Chromosomal localization of the adrenoleukodystrophy- related gene in man and mice. Europ. J. Hum. Genet. 5: 99- .

[4542] Further studies establishing the function and utilities of ABCD2 are found in John Hopkins OMIM database record ID 601081, and in cited publications listed in Table 5, which are hereby incorporated by reference.ABHD4 (Accession NP_071343.1) is another GAM47 target gene, herein designated TARGET GENE. ABHD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABHD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABHD4 BINDING SITE, designated SEQ ID:14056, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4543] Another function of GAM47 is therefore inhibition of ABHD4 (Accession NP_071343.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABHD4.

[4544] ACINUS (Accession NP_055792.1) is another GAM47 target gene, herein designated TARGET GENE. ACINUS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACINUS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACINUS BINDING SITE, designated SEQ ID:5032, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4545] Another function of GAM47 is therefore inhibition of ACINUS (Accession NP_055792.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACINUS.

[4546] A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NP_001101.1) is another GAM47 target gene, herein designated TARGET GENE. ADAM10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM10 BINDING SITE, designated SEQ ID:9109, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4547] Another function of GAM47 is therefore inhibition of A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NP_001101.1), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM10.

[4548] The function of ADAM10 has been established by previous studies. Wolfsberg et al. (1995) identified a family of proteins containing a disintegrin and metalloproteinase (ADAM) domain. Members of this family are cell surface proteins with a unique structure possessing both potential adhesion and protease domains. Tumor necrosis factor-

alpha (TNFA; 191160) is synthesized as a proinflammatory cytokine from a 233- amino acid precursor. Conversion of the membrane- bound precursor to a secreted mature protein is mediated by a protease termed TNFA convertase. Lunn et al. (1997) found that ADAM10 possesses TNFA convertase activity. TNFA is involved in a variety of diseases. To elucidate whether the ADAM10 locus maps to the same region as a disease susceptibility, Yamazaki et al. (1997) mapped the ADAM10 locus. Using a radiation hybrid mapping method, they showed that ADAM10 is located on 15q21.3- q23. Although ephrins form a high-affinity multivalent complex with their receptors present on axons, axons can be rapidly repelled rather than being bound. Hattori et al. (2000) showed that ephrin- A2 (OMIM Ref. No. 602756) forms a stable complex with the metalloproteinase Kuzbanian (OMIM Ref. No. ADAM10) involving interactions outside the cleavage region and the protease domain. Eph receptor binding triggered ephrin-A2 cleavage in a localized reaction specific to the cognate ligand. The cleavage- inhibiting mutation in ephrin- A2 delayed axon withdrawal. Hattori et al. (2000) concluded that their studies reveal mechanisms for protease recognition and control of cell surface proteins, and, for

ephrin- A2, they may provide a means for efficient axon detachment and termination of signaling.

[4549]

[4550] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4551] Lunn, C. A.; Fan, X.; Dalie, B.; Miller, K.; Zavodny, P. J.; Narula, S. K.; Lundell, D. : Purification of ADAM 10 from bovine spleen as a TNFalpha convertase. FEBS Lett. 400: 333- 335, 1997. ; and

[4552] Hattori, M.; Osterfield, M.; Flanagan, J. G. : Regulated cleavage of a contact- mediated axon repellent. Science 289: 1360- 1365, 2000.

[4553] Further studies establishing the function and utilities of ADAM10 are found in John Hopkins OMIM database record ID 602192, and in cited publications listed in Table 5, which are hereby incorporated by reference.A disintegrin-like and metalloprotease (reprolysin type) with throm-bospondin type 1 motif, 5 (aggrecanase-2) (ADAMTS5, Accession NP_008969.1) is another GAM47 target gene, herein designated TARGET GENE. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated re-gion of mRNA encoded by ADAMTS5, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:13500, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4554] Another function of GAM47 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 5 (aggrecanase-2) (ADAMTS5, Accession NP_008969.1), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Arthritic diseases. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Arthritic diseases., and of other diseases and clinical conditions associated with ADAMTS5.

[4555] The function of ADAMTS5 has been established by previous studies. Proteolysis of the extracellular matrix plays a critical role in establishing tissue architecture during development and in tissue degradation in diseases such as cancer, arthritis, Alzheimer disease, and a variety of inflammatory conditions. The proteolytic enzymes responsible include members of diverse protease families and they

may work in concert or in cascades to degrade or process molecules. Two groups of zinc metalloproteinases in particular, ADAMs and MMPs (e.g., 600754), appear broadly relevant to extracellular proteolysis. Most ADAM family members are quite similar in domain organization, bearing, from amino to carboxyl termini, a signal peptide, a proregion, a zinc metalloprotease catalytic domain with the typical reprolysin signature motif, a disintegrin domain, a cysteine- rich domain, an EGF- like domain, and, in many cases, a membrane- spanning region and a cytoplasmic domain with signaling potential. Members of the ADAMTS family differ substantially from the prototypic ADAM structure in that they lack the EGF- like domain, do not have a canonical disintegrin sequence, and possess modules with similar thrombospondin type 1 repeats. By searching an EST database using the protein sequences of human ADAMTS1 to ADAMTS4 and a C. elegans ADAMTS as queries, Hurskainen et al. (1999) identified ADAMTS5, ADAMTS6 (OMIM Ref. No. 605008), and ADAMTS7 (OMIM Ref. No. 605009). They determined a partial human ADAMTS5 cDNA sequence that lacked 5- prime coding sequence. The predicted partial ADAMTS5 protein has the domain structure characteristic of ADAMTSs, beginning

with a partial metalloproteinase domain. Northern blot analysis of several human tissues detected an approximately 10- kb ADAMTS5 transcript that was expressed at a low level in placenta and at barely detectable levels in a number of other tissues. Northern blot analysis showed that mouse Adamts5 was specifically expressed in a 7-day mouse embryo, and at low or undetectable levels thereafter. In situ hybridization of an 8.5- day mouse embryo showed uniform Adamts5 expression throughout the embryo. In addition, Adamts5 expression was found in trophoblastic cells lining the uterine cavity, in the developing placenta, and in the decidual reaction within the uterus. In a 10.5- day mouse embryo, Adamts5 expression was widespread, but at a lower level than in the 8.5-day embryo. Expression was found in mesenchyme and somites, as well as in the neural tube and developing hindgut. Abbaszade et al. (1999) demonstrated that recombinant ADAMTS5 expressed in insect cells cleaves aggrecan at the glu373- ala374 site, with the cleavage pattern and inhibitor profile indistinguishable from that observed with native aggrecanase. Northern blot analysis of several human tissues showed highest ADAMTS5 expression in placenta, with much lower expression in heart and

brain. Major transcripts of 12.4, 10.7, 8.6, and 6.6 kb were detected. Real time PCR of a number of normal human tissues detected ADAMTS5 expression in placenta, cervix, uterus, bladder, and esophagus. Expression was also found in rib cartilage, chondroblastoma, and fibrous tissue and joint capsule samples from an arthritic patient.

[4556]

[4557] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4558] Abbaszade, I.; Liu, R.- Q.; Yang, F.; Rosenfeld, S. A.; Ross, O. H.; Link, J. R.; Ellis, D. M.; Tortorella, M. D.; Pratta, M. A.; Hollis, J. M.; Wynn, R.; Duke, J. L.; and 15 others : Cloning and characterization of ADAMTS11, an aggrecanase from the ADAMTS family. J. Biol. Chem. 274: 23443- 23450, 1999. ; and

[4559] Hurskainen, T. L.; Hirohata, S.; Seldin, M. F.; Apte, S. S. : ADAM- TS5, ADAM- TS6, and ADAM- TS7, novel members of a new family of zinc metalloproteases: general features and genomic dis.

[4560] Further studies establishing the function and utilities of ADAMTS5 are found in John Hopkins OMIM database record ID 605007, and in cited publications listed in Table

5, which are hereby incorporated by reference.ADMP (Accession NP_659472.1) is another GAM47 target gene, herein designated TARGET GENE. ADMP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADMP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE, designated SEQ ID:20029, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4561] Another function of GAM47 is therefore inhibition of ADMP (Accession NP_659472.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADMP.

[4562] Aldo-keto reductase family 1, member b1 (aldose reductase) (AKR1B1, Accession NP_001619.1) is another GAM47 target gene, herein designated TARGET GENE. AKR1B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AKR1B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

AKR1B1 BINDING SITE, designated SEQ ID:5813, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4563] Another function of GAM47 is therefore inhibition of Aldo-keto reductase family 1, member b1 (aldose reductase) (AKR1B1, Accession NP_001619.1), a gene which reduces glucose and other carbonyl- containing substrates and therefore may be associated with Diabetes, galactosemia. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Diabetes, galactosemia, and of other diseases and clinical conditions associated with AKR1B1.

[4564] The function of AKR1B1 has been established by previous studies. See aldehyde reductase (OMIM Ref. No. 103830). Aldose reductase (EC 1.1.1.21) is a member of the monomeric, NADPH- dependent aldoketoreductase family. It catalyzes the reduction of a number of aldehydes, including the aldehyde form of glucose, which is reduced to the corresponding sugar alcohol, sorbitol. Sorbitol is subsequently metabolized to fructose by sorbitol dehydrogenase. Under normal conditions, this pathway plays a minor role in glucose metabolism in most tissues. In diabetic hyperglycemia, however, cells undergoing insulin- indepen-

dent uptake of glucose produce significant quantities of sorbitol. The sorbitol accumulates in cells because of its poor penetration across cellular membranes and its slow metabolism by sorbitol dehydrogenase. The resulting hyperosmotic stress to cells may be a cause of diabetic complications such as neuropathy, retinopathy, and cataracts. Chung and LaMendola (1989) cloned and sequenced the aldose reductase gene from a human placental cDNA library using antibodies against the bovine lens aldose reductase. The deduced amino acid sequence indicated that maturation of aldose reductase involves removal of the N- terminal methionine. Nishimura et al. (1990) also cloned the aldose reductase gene using synthetic oligonucleotide probes based on partial amino acid sequences of purified human psoas muscle aldose reductase. Bohren et al. (1989) isolated aldose reductase and aldehyde reductase cDNAs. They reported that the 2 proteins are 51% identical. Northern blot analysis revealed that aldose reductase was expressed as an approximately 1.4- kb mRNA in placenta. Graham et al. (1991) determined the structure and sequence of the ALDR1 gene by analysis of cDNA and genomic clones. The gene extends over approximately 18 kb and consists of 10 exons, giv-

ing rise to a 1,384 nucleotide mRNA, excluding the poly(A) tail. The gene codes for a 316- amino acid protein with a molecular mass of 35,858 Da. The exons range in size from 82 to 168 bp, whereas the introns range from 325 to about 7,160 bp. A major site of transcription initiation in liver was mapped to an adenine residue 31 nucleotides upstream from the A of the ATG initiation codon. The promoter region of the gene contains a TATA (OMIM Ref. No. TATTTA) box and a CCAAT box, located 37 and 104 nucleotides upstream, respectively, from the transcription initiation site. Graham et al. (1991) found 4 Alu elements in the ALDR1 gene: two in intron 1 and one each in introns 4 and 9. Using the PCR to amplify specifically the human AR sequence in hamster/human hybrid DNA and also in mouse/human monochromosome hybrids, Graham et al. (1991) assigned the gene to chromosome 7. The assignment was confirmed and regionalized to 7q35 by in situ hybridization to human metaphase chromosomes using a novel, rapid method.

[4565]

[4566] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4567] Graham, A.; Brown, L.; Hedge, P. J.; Gammack, A. J.; Markham, A. F. : Structure of the human aldose reductase gene. J. Biol. Chem. 266: 6872- 6877, 1991. ; and

[4568] Nishimura, C.; Matsuura, Y.; Kokai, Y.; Akera, T.; Carper, D.; Morjana, N.; Lyons, C.; Flynn, T. G. : Cloning and expression of human aldose reductase. J. Biol. Chem. 265: 9788- 9792, 199.

[4569] Further studies establishing the function and utilities of AKR1B1 are found in John Hopkins OMIM database record ID 103880, and in cited publications listed in Table 5, which are hereby incorporated by reference.Alkb, alkylation repair homolog (e. coli) (ALKBH, Accession NP_006011.1) is another GAM47 target gene, herein designated TARGET GENE. ALKBH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALKBH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALKBH BINDING SITE, designated SEQ ID:8481, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4570] Another function of GAM47 is therefore inhibition of Alkb, alkylation repair homolog (e. coli) (ALKBH, Accession

NP_006011.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALKBH.

[4571] Arachidonate 12-lipoxygenase, 12r type (ALOX12B, Accession NP_001130.1) is another GAM47 target gene, herein designated TARGET GENE. ALOX12B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ALOX12B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALOX12B BINDING SITE, designated SEQ ID:9630, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4572] Another function of GAM47 is therefore inhibition of Arachidonate 12-lipoxygenase, 12r type (ALOX12B, Accession NP_001130.1), a gene which converts arachidonic acid to 12r- hydroperoxyeicosatetraenoic acid (12r-hpete). and therefore is associated with Ichthyosiform erythroderma. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Ichthyosiform erythroderma, and of other diseases and clinical conditions associated with ALOX12B.

[4573] The function of ALOX12B has been established by previous studies. 12R- lipoxygenase catalyzes the conversion of arachidonic acid to 12R- hydroxyeicosatetraenoic acid (12R- HETE). In a database search for novel lipoxygenases, Sun et al. (1998) identified a novel lipoxygenase gene. The cDNA encoded a 701- amino acid polypeptide which when expressed produced a protein with specific 12R- lipoxygenase activity. By RT- PCR, but not by Northern blot analysis, Sun et al. (1998) detected 12R- lipoxygenase mRNA in B cells and adult skin. Boeglin et al. (1998) also cloned the ALOX12B gene. The ALOX12B cDNA showed the greatest sequence similarity to the second type of human 15S- lipoxygenase (ALOX15B; 603697), and was more distantly related to human 12S- lipoxygenase (ALOX12; 152391). They showed that ALOX12B is expressed in keratinocytes and psoriatic scales, but they were not able to detect any transcription of the gene on several multiple- tissue Northern blots. Boeglin et al. (1998) provided mechanistic evidence for a lipoxygenase route to 12R- HETE in human psoriatic tissue and described a 12R- lipoxygenase that could account for the biosynthesis.

[4574]

[4575] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4576] Boeglin, W. E.; Kim, R. B.; Brash, A. R. : A 12R- lipoxygenase in human skin: mechanistic evidence, molecular cloning, and expression. Proc. Nat. Acad. Sci. 95: 6744-6749, 1998. ; and

[4577] Jobard, F.; Lefevre, C.; Karaduman, A.; Blanchet- Bardon, C.; Emre, S.; Weissenbach, J.; Ozguc, M.; Lathrop, M.; Prud'homme, J.- F.; Fischer, J. : Lipoxygenase- 3 (ALOXE3) and 12(R)- lipoxy.

[4578] Further studies establishing the function and utilities of ALOX12B are found in John Hopkins OMIM database record ID 603741, and in cited publications listed in Table 5, which are hereby incorporated by reference.Amphiphysin (stiff-man syndrome with breast cancer 128kda autoantigen) (AMPH, Accession NP_647477.1) is another GAM47 target gene, herein designated TARGET GENE. AMPH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AMPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of AMPH BINDING SITE, designated SEQ ID:18267, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4579] Another function of GAM47 is therefore inhibition of Amphiphysin (stiff-man syndrome with breast cancer 128kda autoantigen) (AMPH, Accession NP_647477.1), a gene which is a synaptic vesicle protein and therefore may be associated with Stiff- man syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Stiff- man syndrome, and of other diseases and clinical conditions associated with AMPH.

[4580] The function of AMPH has been established by previous studies. Stiff- man syndrome (OMIM Ref. No. 184850) is a rare disease of the central nervous system characterized by progressive rigidity of the body musculature with superimposed painful spasms. An autoimmune origin of the disease has been proposed. Approximately 60% of patients are positive for autoantibodies directed against the GABA- synthesizing enzyme glutamic acid decarboxylase (GAD; 605363). A few patients, all women affected by breast cancer, were found to be negative for GAD autoantibodies but positive for autoantibodies directed against a

128- kD synaptic protein. De Camilli et al. (1993) found that this antigen is amphiphysin. Both GAD and amphiphysin are nonintrinsic membrane proteins that are concentrated in nerve terminals, where a pool of the 2 proteins is associated with the cytoplasmic surface of synaptic vesicles. David et al. (1994) found that the N- and C- terminal domains of the amphiphysin protein are highly conserved between chicken and human. Autoantibodies from patients with the stiff- man syndrome show a dominant autoepitope located in the C- terminal region, which contains an SH3 domain. By PCR analysis of hybrid cell DNAs and by fluorescence in situ hybridization, Yamamoto et al. (1995) mapped the AMPH gene to 7p14-p13. They noted that the tissue distribution of AMPH and its association with neurotransmitter vesicles make the gene a candidate for involvement in such diverse heritable disorders as those of the nervous system, certain endocrine tissues (such as the adrenal medulla, pituitary gland or endocrine pancreas), or male fertility. They noted further that 2 disorders of the retina, retinitis pigmentosa- 9 (RP9; 180104) and dominant cystoid macular dystrophy (MDDC; 153880), have been assigned to the same chromosomal region. Clearly, AMPH expression is not re-

stricted to the retina, but neither are the products of genes responsible for some other forms of retinal degeneration, such as gyrate atrophy (OMIM Ref. No. 258870) and choroideremia (OMIM Ref. No. 303100).

[4581]

[4582] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4583] David, C.; Solimena, M.; De Camilli, P. : Autoimmunity in stiff- man syndrome with breast cancer is targeted to the C- terminal region of human amphiphysin, a protein similar to the yeast proteins, Rvs167 and Rvs161. FEBS Lett. 351: 73- 79, 1994. ; and

[4584] De Camilli, P.; Thomas, A.; Cofiell, R.; Folli, F.; Lichte, B.; Piccolo, G.; Meinck, H.- M.; Austoni, M.; Fassetta, G.; Bottazzo, G.; Bates, D.; Cartlidge, N.; Solimena, M.; Kilimann, M.

[4585] Further studies establishing the function and utilities of AMPH are found in John Hopkins OMIM database record ID 600418, and in cited publications listed in Table 5, which are hereby incorporated by reference.Amphiphysin (stiff-man syndrome with breast cancer 128kda autoantigen) (AMPH, Accession NP_001626.1) is another GAM47

target gene, herein designated TARGET GENE. AMPH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AMPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMPH BINDING SITE, designated SEQ ID:18267, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4586] Another function of GAM47 is therefore inhibition of Amphiphysin (stiff-man syndrome with breast cancer 128kda autoantigen) (AMPH, Accession NP_001626.1), a gene which is a synaptic vesicle protein and therefore may be associated with Stiff- man syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Stiff- man syndrome, and of other diseases and clinical conditions associated with AMPH.

[4587] The function of AMPH has been established by previous studies. Stiff- man syndrome (OMIM Ref. No. 184850) is a rare disease of the central nervous system characterized by progressive rigidity of the body musculature with superimposed painful spasms. An autoimmune origin of the disease has been proposed. Approximately 60% of pa-

tients are positive for autoantibodies directed against the GABA- synthesizing enzyme glutamic acid decarboxylase (GAD; 605363). A few patients, all women affected by breast cancer, were found to be negative for GAD autoantibodies but positive for autoantibodies directed against a 128- kD synaptic protein. De Camilli et al. (1993) found that this antigen is amphiphysin. Both GAD and amphiphysin are nonintrinsic membrane proteins that are concentrated in nerve terminals, where a pool of the 2 proteins is associated with the cytoplasmic surface of synaptic vesicles. David et al. (1994) found that the N- and C- terminal domains of the amphiphysin protein are highly conserved between chicken and human. Autoantibodies from patients with the stiff- man syndrome show a dominant autoepitope located in the C- terminal region, which contains an SH3 domain. By PCR analysis of hybrid cell DNAs and by fluorescence in situ hybridization, Yamamoto et al. (1995) mapped the AMPH gene to 7p14-p13. They noted that the tissue distribution of AMPH and its association with neurotransmitter vesicles make the gene a candidate for involvement in such diverse heritable disorders as those of the nervous system, certain endocrine tissues (such as the adrenal medulla, pituitary

gland or endocrine pancreas), or male fertility. They noted further that 2 disorders of the retina, retinitis pigmentosa- 9 (RP9; 180104) and dominant cystoid macular dystrophy (MDDC; 153880), have been assigned to the same chromosomal region. Clearly, AMPH expression is not restricted to the retina, but neither are the products of genes responsible for some other forms of retinal degeneration, such as gyrate atrophy (OMIM Ref. No. 258870) and choroideremia (OMIM Ref. No. 303100).

[4588]

[4589] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4590] David, C.; Solimena, M.; De Camilli, P. : Autoimmunity in stiff- man syndrome with breast cancer is targeted to the C- terminal region of human amphiphysin, a protein similar to the yeast proteins, Rvs167 and Rvs161. FEBS Lett. 351: 73- 79, 1994. ; and

[4591] De Camilli, P.; Thomas, A.; Cofiell, R.; Folli, F.; Lichte, B.; Piccolo, G.; Meinck, H.- M.; Austoni, M.; Fassetta, G.; Bottazzo, G.; Bates, D.; Cartlidge, N.; Solimena, M.; Kilimann, M.

[4592] Further studies establishing the function and utilities of

AMPH are found in John Hopkins OMIM database record ID 600418, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ankyrin 2, neuronal (ANK2, Accession NP_001139.2) is another GAM47 target gene, herein designated TARGET GENE. ANK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK2 BINDING SITE, designated SEQ ID:17426, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4593] Another function of GAM47 is therefore inhibition of Ankyrin 2, neuronal (ANK2, Accession NP_001139.2), a gene which attaches integral membrane proteins to cytoskeletal elements. also binds to cytoskeletal proteins. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK2.

[4594] The function of ANK2 has been established by previous studies. Tse et al. (1991) studied immunoreactive isoforms of erythrocyte ankyrin found in nonerythroid tis-

sues. Using an erythrocyte ankyrin cDNA clone as a hybridization probe, they isolated a clone from a human genomic library that hybridized at low but not at high stringency. Further studies suggested that the clone represented part of a gene for nonerythroid ankyrin, which they designated ANK2. By analysis of somatic cell hybrids and by fluorescence in situ hybridization, they assigned ANK2 to 4q25- q27. Otto et al. (1991) isolated and sequenced cDNAs related to 2 brain ankyrin isoforms and showed that they are produced through alternative splicing of the mRNA from a single gene. By analysis of human/rodent cell hybrids, Otto et al. (1991) assigned the brain ankyrin gene to chromosome 4.

[4595]

[4596] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4597] Otto, E.; Kunimoto, M.; McLaughlin, T.; Bennett, V. : Isolation and characterization of cDNAs encoding human brain ankyrins reveal a family of alternatively spliced genes. J. Cell Biol. 114: 241- 253, 1991. ; and

[4598] Tse, W. T.; Menninger, J. C.; Yang- Feng, T. L.; Francke, U.; Sahr, K. E.; Lux, S. E.; Ward, D. C.; Forget, B. G. : Isolation

and chromosomal localization of a novel non- erythroid ankyri.

[4599] Further studies establishing the function and utilities of ANK2 are found in John Hopkins OMIM database record ID 106410, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ankyrin 2, neuronal (ANK2, Accession NP_066187.1) is another GAM47 target gene, herein designated TARGET GENE. ANK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK2 BINDING SITE, designated SEQ ID:17426, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4600] Another function of GAM47 is therefore inhibition of Ankyrin 2, neuronal (ANK2, Accession NP_066187.1), a gene which attaches integral membrane proteins to cytoskeletal elements. also binds to cytoskeletal proteins. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK2.

[4601] The function of ANK2 has been established by previous studies. Tse et al. (1991) studied immunoreactive isoforms of erythrocyte ankyrin found in nonerythroid tissues. Using an erythrocyte ankyrin cDNA clone as a hybridization probe, they isolated a clone from a human genomic library that hybridized at low but not at high stringency. Further studies suggested that the clone represented part of a gene for nonerythroid ankyrin, which they designated ANK2. By analysis of somatic cell hybrids and by fluorescence in situ hybridization, they assigned ANK2 to 4q25- q27. Otto et al. (1991) isolated and sequenced cDNAs related to 2 brain ankyrin isoforms and showed that they are produced through alternative splicing of the mRNA from a single gene. By analysis of human/rodent cell hybrids, Otto et al. (1991) assigned the brain ankyrin gene to chromosome 4.

[4602]

[4603] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4604] Otto, E.; Kunimoto, M.; McLaughlin, T.; Bennett, V. : Isolation and characterization of cDNAs encoding human brain ankyrins reveal a family of alternatively spliced genes. J.

Cell Biol. 114: 241- 253, 1991. ; and

[4605] Tse, W. T.; Menninger, J. C.; Yang- Feng, T. L.; Francke, U.; Sahr, K. E.; Lux, S. E.; Ward, D. C.; Forget, B. G. : Isolation and chromosomal localization of a novel non- erythroid ankyri.

[4606] Further studies establishing the function and utilities of ANK2 are found in John Hopkins OMIM database record ID 106410, and in cited publications listed in Table 5, which are hereby incorporated by reference.ANP32E (Accession NP_112182.1) is another GAM47 target gene, herein designated TARGET GENE. ANP32E BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ANP32E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANP32E BINDING SITE, designated SEQ ID:16499, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4607] Another function of GAM47 is therefore inhibition of ANP32E (Accession NP_112182.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANP32E.

[4608] Amine oxidase, copper containing 3 (vascular adhesion protein 1) (AOC3, Accession NP_003725.1) is another GAM47 target gene, herein designated TARGET GENE. AOC3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AOC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AOC3 BINDING SITE, designated SEQ ID:17921, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4609] Another function of GAM47 is therefore inhibition of Amine oxidase, copper containing 3 (vascular adhesion protein 1) (AOC3, Accession NP_003725.1), a gene which catalyze the oxidative conversion of amines to aldehydes in the presence of copper and quinone cofactor. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOC3.

[4610] The function of AOC3 has been established by previous studies. Zhang and McIntire (1996) cloned a novel amine oxidase, HPAO, from a human placenta cDNA library. The gene encodes a 763- amino acid polypeptide which con-

tains a secretory signal sequence. Morris et al. (1997) cloned a partial rat cDNA which they identified as the rat homolog of HPAO. They reported that the product is a major protein on the adipocyte plasma membrane. Smith et al. (1998) studied vascular adhesion protein- 1 (VAP1), a molecule expressed in endothelial cells that mediates binding of lymphocytes. These authors noted that the amino acid sequence of VAP1 was identical to that of HPAO. Expression studies revealed that the VAP1 protein has adhesive properties and also has functional monoamine oxidase activity. Northern blot analysis detected a 4.1- kb mRNA in a wide variety of human tissues.

[4611]

[4612] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4613] Morris, N. J.; Ducret, A.; Aebersold, R.; Ross, S. A.; Keller, S. R.; Lienhard, G. E. : Membrane amine oxidase cloning and identification as a major protein in the adipocyte plasma membrane. J. Biol. Chem. 272: 9388- 9392, 1997. ; and

[4614] Smith, D. J.; Salmi, M.; Bono, P.; Hellman, J.; Leu, T.; Jalkanen, S. : Cloning of vascular adhesion protein 1 reveals a

novel multifunctional adhesion molecule. J. Exp. Med. 188: 17- 27.

[4615] Further studies establishing the function and utilities of AOC3 are found in John Hopkins OMIM database record ID 603735, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542118.1) is another GAM47 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:6227, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4616] Another function of GAM47 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542118.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[4617] Adaptor-related protein complex 1, sigma 1 subunit

(AP1S1, Accession NP_476430.1) is another GAM47 target gene, herein designated TARGET GENE. AP1S1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1S1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1S1 BINDING SITE, designated SEQ ID:5641, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4618] Another function of GAM47 is therefore inhibition of Adaptor-related protein complex 1, sigma 1 subunit (AP1S1, Accession NP_476430.1), a gene which promotes the formation of clathrin- coated pits and vesicles. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S1.

[4619] The function of AP1S1 has been established by previous studies. Clathrin and its associated heterotetrameric protein complexes (APs) are the main protein components of the coat surrounding the cytoplasmic face of coated vesicles. Two main types of APs, AP- 1 and AP- 2, are found in clathrin- coated structures located at the Golgi complex

and the plasma membrane of mammalian cells, respectively. AP- 1 is composed of 2 large chains, beta- prime-adaptin (OMIM Ref. No. 600157) and gamma- adaptin (OMIM Ref. No. 603533); a medium (mu) chain, AP47 (OMIM Ref. No. 603535); and a small (sigma) chain, AP19. Kirchhausen et al. (1991) isolated cDNAs encoding mouse AP19 and rat AP17 (OMIM Ref. No. 602242), the small subunit of AP- 2. The predicted rat AP17 shares 45% protein sequence identity with mouse AP19. Takatsu et al. (1998) identified a human cDNA encoding AP19, which they designated sigma- 1A. They reported that the predicted mouse and human AP19 proteins are identical. Northern blot analysis revealed that the approximately 1.4- kb AP19 mRNA was expressed ubiquitously in human tissues

[4620]

[4621] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4622] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP- 1 in packaging MPRs at the trans- Golgi network. Science 297: 1700- 1703, 2002. ; and

[4623] Kirchhausen, T.; Davis, A. C.; Frucht, S.; O'Brine Greco, B.; Payne, G. S.; Tubb, B. : AP17 and AP19, the mammalian small chains of the clathrin- associated protein complexes show homol.

[4624] Further studies establishing the function and utilities of AP1S1 are found in John Hopkins OMIM database record ID 603531, and in cited publications listed in Table 5, which are hereby incorporated by reference.APLN (Accession NP_059109.2) is another GAM47 target gene, herein designated TARGET GENE. APLN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APLN BINDING SITE, designated SEQ ID:12239, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4625] Another function of GAM47 is therefore inhibition of APLN (Accession NP_059109.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APLN.

[4626] APM1 (Accession NP_004788.1) is another GAM47 target

gene, herein designated TARGET GENE. APM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:913, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4627] Another function of GAM47 is therefore inhibition of APM1 (Accession NP_004788.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1.

[4628] Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3c (APOBEC3C, Accession NP_055323.2) is another GAM47 target gene, herein designated TARGET GENE. APOBEC3C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APOBEC3C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOBEC3C BINDING SITE, designated SEQ ID:19621, to the nucleotide sequence of

GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4629] Another function of GAM47 is therefore inhibition of Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3c (APOBEC3C, Accession NP_055323.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOBEC3C.

[4630] Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3f (APOBEC3F, Accession NP_660341.2) is another GAM47 target gene, herein designated TARGET GENE. APOBEC3F BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APOBEC3F, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOBEC3F BINDING SITE, designated SEQ ID:18776, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4631] Another function of GAM47 is therefore inhibition of Apolipoprotein b mrna editing enzyme, catalytic polypeptide-like 3f (APOBEC3F, Accession NP_660341.2) . Accordingly, utilities of GAM47 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with APOBEC3F.

[4632] Amyloid beta (a4) precursor protein (protease nexin-ii, alzheimer disease) (APP, Accession NP_000475.1) is another GAM47 target gene, herein designated TARGET GENE. APP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APP BINDING SITE, designated SEQ ID:4997, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4633] Another function of GAM47 is therefore inhibition of Amyloid beta (a4) precursor protein (protease nexin-ii, alzheimer disease) (APP, Accession NP_000475.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APP.

[4634] Androgen receptor (dihydrotestosterone receptor; testicular feminization; spinal and bulbar muscular atrophy; kennedy disease) (AR, Accession NP_000035.2) is another GAM47 target gene, herein designated TARGET GENE. AR

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AR BINDING SITE, designated SEQ ID:7646, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4635] Another function of GAM47 is therefore inhibition of Androgen receptor (dihydrotestosterone receptor; testicular feminization; spinal and bulbar muscular atrophy; kennedy disease) (AR, Accession NP_000035.2), a gene which are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues. and therefore is associated with Androgen insensitivity syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Androgen insensitivity syndrome, and of other diseases and clinical conditions associated with AR.

[4636] The function of AR has been established by previous studies. The length of a polymorphic CAG repeat sequence occurring in the androgen receptor gene is inversely correlated with transcriptional activity by the an-

drogen receptor. Men who possess exceptionally long CAG repeat lengths experience clinical androgen insensitivity, presumably related to reduced transcriptional activity of the receptor. Prostate carcinogenesis is dependent on androgens. Because shorter CAG repeat lengths are associated with high transcriptional activity of AR, Irvine et al. (1995) proposed that men with shorter repeat lengths will be at higher risk for prostate cancer. Some indirect evidence is consistent with this hypothesis. African-Americans, who have generally shorter CAG repeat lengths in the AR gene, have a higher incidence and mortality rate from prostate cancer (Coetzee and Ross, 1994). Moreover, because of X linkage, a history of disease in a brother carries greater risk than paternal history. Against this background, Giovannucci et al. (1997) conducted within the Physician's Health Study a nested case- controlled study of 587 newly diagnosed cases of prostate cancer detected between 1982 and 1995, and 588 controls without prostate cancer. They found an association between fewer androgen receptor gene CAG repeats and higher risk of total prostate cancer. In particular, a shorter CAG repeat sequence was associated with cancers characterized by extraprostatic extension, distant metastases, or

high histologic grade. Variability in the CAG repeat length was not associated with low- grade or low- stage disease.

[4637] Animal model experiments lend further support to the function of AR. Abel et al. (2001) created transgenic mice that developed many of the motor symptoms of SBMA and had a truncated, highly expanded androgen receptor gene driven by the neurofilament light chain (OMIM Ref. No. 162280) promoter. In addition, transgenic mice created with the prion protein (OMIM Ref. No. 176640) promoter developed widespread neurologic disease, reminiscent of juvenile forms of other polyglutamine diseases. The distribution of neurologic symptoms depended on the expression level and pattern of the promoter used, rather than on specific characteristics of androgen receptor metabolism or function. The transgenic mice that were generated developed neuronal intranuclear inclusions (NIIs), a hallmark of SBMA and the other polyglutamine diseases. These inclusions were ubiquitinated and sequestered molecular chaperones, components of the 26S proteasome (OMIM Ref. No. 604449) and the transcriptional activator CREB- binding protein. Apart from the presence of NIIs, evidence of neuropathology or neurogenic muscle atrophy was absent, suggesting to the au-

thors that the neurologic phenotypes observed were the result of neuronal dysfunction rather than neuronal degeneration.

[4638] It is appreciated that the abovementioned animal model for AR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4639] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4640] Abel, A.; Walcott, J.; Woods, J.; Duda, J.; Merry, D. E. : Expression of expanded repeat androgen receptor produces neurologic disease in transgenic mice. Hum. Molec. Genet. 10: 107- 116, 2001. ; and

[4641] Irvine, R. A.; Yu, M. C.; Ross, R. K.; Coetzee, G. A. : The CAG and GGC microsatellites of the androgen receptor gene are in linkage disequilibrium in men with prostate cancer. Cancer.

[4642] Further studies establishing the function and utilities of AR are found in John Hopkins OMIM database record ID 313700, and in cited publications listed in Table 5, which are hereby incorporated by reference.Artemin (ARTN, Accession NP_003967.1) is another GAM47 target gene,

herein designated TARGET GENE. ARTN BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ARTN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARTN BINDING SITE, designated SEQ ID:2193, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4643] Another function of GAM47 is therefore inhibition of Artemin (ARTN, Accession NP_003967.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARTN.

[4644] N-acylsphingosine amidohydrolase (acid ceramidase) 1 (ASAH1, Accession NP_808592.1) is another GAM47 target gene, herein designated TARGET GENE. ASAH1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ASAH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASAH1 BINDING SITE, designated

SEQ ID:17659, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4645] Another function of GAM47 is therefore inhibition of N-acylsphingosine amidohydrolase (acid ceramidase) 1 (ASAH1, Accession NP_808592.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASAH1.

[4646] N-acylsphingosine amidohydrolase (acid ceramidase) 1 (ASAH1, Accession NP_004306.2) is another GAM47 target gene, herein designated TARGET GENE. ASAH1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ASAH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASAH1 BINDING SITE, designated SEQ ID:17659, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4647] Another function of GAM47 is therefore inhibition of N-acylsphingosine amidohydrolase (acid ceramidase) 1 (ASAH1, Accession NP_004306.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASAH1.

[4648] Ankyrin repeat and socs box-containing 1 (ASB1, Accession NP_057198.1) is another GAM47 target gene, herein designated TARGET GENE. ASB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB1 BINDING SITE, designated SEQ ID:18379, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4649] Another function of GAM47 is therefore inhibition of Ankyrin repeat and socs box-containing 1 (ASB1, Accession NP_057198.1), a gene which May mediate protein-protein interactions. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB1.

[4650] The function of ASB1 has been established by previous studies. Suppressor of cytokine signaling (SOCS) protein expression is induced by cytokines in a range of tissues, and they appear to act in a negative feedback loop to regulate signal transduction. Members of the SOCS family are characterized by a variable N- terminal sequence, a central SH2 domain, and a conserved C- terminal SOCS box.

They mediate their inhibitory functions through interactions with JAK (e.g., JAK3; 600173) kinases. By EST database searching, probing a mouse spleen cDNA library, and further database searching, Kile et al. (2000) identified a cDNA encoding ASB1, which is identical to the KIAA1146 gene identified by Hirosawa et al. (1999). Sequence analysis predicted that the 335- amino acid protein, which is 94% identical to the mouse protein, contains 6 ankyrin repeats and a C- terminal SOCS box. Northern blot analysis of mouse tissues revealed wide expression of a 5.5- kb transcript, with highest expression in testis, spleen, and bone marrow. Genomic sequence analysis determined that the ASB1 gene contains at least 5 exons.

[4651]

[4652] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4653] Hirosawa, M.; Nagase, T.; Ishikawa, K.; Kikuno, R.; Nomura, N.; Ohara, O. : Characterization of cDNA clones selected by the GeneMark analysis from size- fractionated cDNA libraries from human brain. DNA Res. 6: 329- 336, 1999. ; and

[4655] Further studies establishing the function and utilities of ASB1 are found in John Hopkins OMIM database record ID 605758, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atpase, na+/k+ transporting, alpha 3 polypeptide (ATP1A3, Accession NP_689509.1) is another GAM47 target gene, herein designated TARGET GENE. ATP1A3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1A3 BINDING SITE, designated SEQ ID:12442, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4656] Another function of GAM47 is therefore inhibition of Atpase, na+/k+ transporting, alpha 3 polypeptide (ATP1A3, Accession NP_689509.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A3.

[4657] Atpase inhibitory factor 1 (ATPIF1, Accession NP_835498.1) is another GAM47 target gene, herein designated TARGET GENE. ATPIF1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATPIF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATPIF1 BINDING SITE, designated SEQ ID:6903, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4658] Another function of GAM47 is therefore inhibition of Atpase inhibitory factor 1 (ATPIF1, Accession NP_835498.1). Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATPIF1.

[4659] Attractin (ATRN, Accession NP_647537.1) is another GAM47 target gene, herein designated TARGET GENE. ATRN BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATRN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:1478, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4660] Another function of GAM47 is therefore inhibition of Attractin (ATRN, Accession NP_647537.1), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN.

[4661] The function of ATRN has been established by previous studies. Attractin is a human serum glycoprotein that is rapidly expressed on activated T cells and released extracellularly after 48 to 72 hours. Duke- Cohan et al. (1998) cloned attractin and found that, as in its natural serum form, it mediates the spreading of monocytes that becomes the focus for the clustering of nonproliferating T lymphocytes. There are 2 mRNA species with hematopoietic tissue- specific expression that code for a 134- kD protein with a putative serine protease catalytic serine, 4 EGF- like motifs, a CUB domain, a C- type lectin domain, and a domain homologous with the ligand- binding region of the common gamma cytokine chain. Except for the last 2 domains, the overall structure shares high homol-

ogy with a protein of Caenorhabditis elegans, suggesting that attractin has evolved new domains and functions in parallel with the development of cell- mediated immunity. When attractin was identified as the product of the murine 'mahogany' gene with connections to control of pigmentation and energy metabolism, and the 'mahogany' product was identified and shown to be a transmembrane protein, the possibility of a human membrane attractin in addition to the secreted form was raised. Tang et al. (2000) described the complete genomic sequence of attractin, focusing in particular on the exons coding for the 3- prime region, and showed how both human membrane and secreted attractin arise as a result of alternate splicing of the same gene. They found that soluble attractin arises from transcription of 25 sequential exons on 20p13, where the 3- prime terminal exon contains sequence from a long interspersed nuclear element- 1 (OMIM Ref. No. LINE- 1) retrotransposon insertion that includes a stop codon and a polyadenylation signal. The mRNA isoform for membrane attraction splices over the LINE- 1 exon and includes 5 exons encoding transmembrane and cytoplasmic domains with organization and coding potential almost identical to that of the mouse gene. The relative abun-

dance of soluble and transmembrane isoforms measured by RT- PCR is differentially regulated in lymphoid tissues. Because activation of peripheral blood leukocytes with phytohemagglutinin induces strong expression of cell surface attractin followed by release of soluble attractin, these results suggested to Tang et al. (2000) that LINE- 1 insertion, a genomic event unique to mammals, provided an evolutionarily mechanism for regulating cell interactions during an inflammatory reaction.

[4662]

[4663] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4664] Duke- Cohan, J. S.; Gu, J.; McLaughlin, D. F.; Xu, Y.; Freeman, G. J.; Schlossman, S. [4666] Further studies establishing the function and utilities of ATRN are found in John Hopkins OMIM database record ID 603130, and in cited publications listed in Table 5, which are hereby incorporated by reference.Axl receptor tyrosine kinase (AXL, Accession NP_001690.2) is another GAM47 target gene, herein designated TARGET GENE. AXL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AXL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE, designated SEQ ID:5379, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4667] Another function of GAM47 is therefore inhibition of Axl receptor tyrosine kinase (AXL, Accession NP_001690.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL.

[4668] Axl receptor tyrosine kinase (AXL, Accession NP_068713.2) is another GAM47 target gene, herein designated TARGET GENE. AXL BINDING SITE is a target binding site found in the 3` untranslated region of multiple

transcripts of mRNA encoded by AXL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE, designated SEQ ID:5379, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4669] Another function of GAM47 is therefore inhibition of Axl receptor tyrosine kinase (AXL, Accession NP_068713.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL.

[4670] Brain and acute leukemia, cytoplasmic (BAALC, Accession NP_079088.1) is another GAM47 target gene, herein designated TARGET GENE. BAALC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAALC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:7066, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4671] Another function of GAM47 is therefore inhibition of Brain

and acute leukemia, cytoplasmic (BAALC, Accession NP_079088.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC.

[4672] Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) is another GAM47 target gene, herein designated TARGET GENE. BAZ2A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BAZ2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAZ2A BINDING SITE, designated SEQ ID:12314, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4673] Another function of GAM47 is therefore inhibition of Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2A.

[4674] Bcl2-like 13 (apoptosis facilitator) (BCL2L13, Accession NP_056182.1) is another GAM47 target gene, herein designated TARGET GENE. BCL2L13 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by BCL2L13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL2L13 BINDING SITE, designated SEQ ID:1370, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4675] Another function of GAM47 is therefore inhibition of Bcl2-like 13 (apoptosis facilitator) (BCL2L13, Accession NP_056182.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L13.

[4676] BIA2 (Accession NP_056246.1) is another GAM47 target gene, herein designated TARGET GENE. BIA2 BINDING SITE1 and BIA2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by BIA2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BIA2 BINDING SITE1 and BIA2 BINDING SITE2, designated SEQ ID:18069 and SEQ ID:11493 respectively, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[4677] Another function of GAM47 is therefore inhibition of BIA2 (Accession NP_056246.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIA2.

[4678] BIG1 (Accession NP_006412.1) is another GAM47 target gene, herein designated TARGET GENE. BIG1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BIG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BIG1 BINDING SITE, designated SEQ ID:7522, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4679] Another function of GAM47 is therefore inhibition of BIG1 (Accession NP_006412.1), a gene which is a guanine nucleotide- exchange protein, has a role in vesicular transport. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIG1.

[4680] The function of BIG1 has been established by previous studies. After peptide sequencing of purified bovine p200,

Togawa et al. (1999) used PCR generated probes to screen a human frontal cortex cDNA library and isolated BIG1 and BIG2 (OMIM Ref. No. 605371) cDNAs. The assembled full-length BIG1 cDNA encodes a protein of 1,849 amino acids containing a Sec7 domain characteristic of ARF guanine nucleotide- exchange proteins. BIG1 shares 74% overall amino acid identity with BIG2 and 90% identity in the Sec7 domain. Using Northern blot analysis, Togawa et al. (1999) detected a 7.5- kb BIG1 transcript in placenta and lung. Weaker expression was detected in heart, brain, kidney, and pancreas. Mansour et al. (1999) studied the ubiquitously expressed ARFGEP1 protein and proposed that accumulation of an abortive p200- ARF complex in the presence of BFA likely leads to disruption of Golgi morphology. Database searches revealed the presence of putative isoforms whose inhibition may account for the effects of BFA on various organelles.

[4681]

[4682] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4683] Togawa, A.; Morinaga, N.; Ogasawara, M.; Moss, J.; Vaughan, M. : Purification and cloning of a brefeldin A-

inhibited guanine nucleotide- exchange protein for ADP-ribosylation factors. J. Biol. Chem. 274: 12308- 12315, 1999. ; and

[4684] Mansour, S. J.; Skaug, J.; Zhao, X.- H.; Giordano, J.; Scherer, S. W.; Melancon, P. : p200 ARF- GEP1: a Golgi-localized guanine nucleotide exchange protein whose Sec7 domain is targeted b.

[4685] Further studies establishing the function and utilities of BIG1 are found in John Hopkins OMIM database record ID 604141, and in cited publications listed in Table 5, which are hereby incorporated by reference.Bone morphogenetic protein 4 (BMP4, Accession NP_570912.1) is another GAM47 target gene, herein designated TARGET GENE. BMP4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BMP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMP4 BINDING SITE, designated SEQ ID:18502, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4686] Another function of GAM47 is therefore inhibition of Bone morphogenetic protein 4 (BMP4, Accession NP_570912.1),

a gene which acts in mesoderm induction, tooth development, limb formation and fracture repair and therefore may be associated with Fibrodysplasia ossificans progressiva. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Fibrodysplasia ossificans progressiva, and of other diseases and clinical conditions associated with BMP4.

[4687] The function of BMP4 has been established by previous studies. Shafritz et al. (1996) found overexpression of BMP4 in lymphoblastoid cell lines from 26 of 32 patients with fibrodysplasia ossificans progressiva (FOP; 135100), but from only 1 of 12 normal subjects (P less than 0.001). Furthermore, BMP4 and its mRNA were detected in the lymphoblastoid cell lines from a man with FOP and his 3 affected children, but not from the children's unaffected mother. Cosegregation of DNA markers for the BMP4 locus on chromosome 14 in the rare families in which FOP is inherited would strengthen the candidacy of BMP4, and the demonstration of mutations in the BMP4 gene, especially in the promoter sequences, would be confirmatory.

[4688] Animal model experiments lend further support to the function of BMP4. Connor (1996) speculated that transgenic mice with selective overexpression of BMP4 may

serve as animal models of FOP and may make it possible to evaluate potential therapies directed at influencing the expression of BMP4 or its 2 types of cell- surface receptors. Not only may this knowledge provide a rational basis for therapy for FOP, but possibly also measures for the control of local ectopic bone development which occurs in 10 to 20% of patients who have undergone surgical hip replacement. According to Connor (1996), there appears to be an individual propensity to the phenomenon of secondary ectopic ossification of soft tissue. In the 10 to 20% of patients who develop local ectopic bone formation after hip replacement, if surgical removal of that bone is attempted or the opposite hip is replaced, ectopic bone almost invariably recurs or occurs.

[4689] It is appreciated that the abovementioned animal model for BMP4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4690] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4691] Shafritz, A. B.; Shore, E. M.; Gannon, F. H.; Zasloff, M. A.; Taub, R.; Muenke, M.; Kaplan, F. S. : Overexpression of an

osteogenic morphogen in fibrodysplasia ossificans progressiva. New Eng. J. Med. 335: 555- 561, 1996. ; and

[4692] Connor, J. M. : Fibrodysplasia ossificans progressiva: lessons from rare maladies. (Editorial) New Eng. J. Med. 335: 591- 593, 1996.

[4693] Further studies establishing the function and utilities of BMP4 are found in John Hopkins OMIM database record ID 112262, and in cited publications listed in Table 5, which are hereby incorporated by reference.Bone morphogenetic protein 4 (BMP4, Accession NP_001193.1) is another GAM47 target gene, herein designated TARGET GENE. BMP4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BMP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMP4 BINDING SITE, designated SEQ ID:18502, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4694] Another function of GAM47 is therefore inhibition of Bone morphogenetic protein 4 (BMP4, Accession NP_001193.1), a gene which acts in mesoderm induction, tooth development, limb formation and fracture repair and therefore

may be associated with Fibrodysplasia ossificans progressiva. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Fibrodysplasia ossificans progressiva, and of other diseases and clinical conditions associated with BMP4.

[4695] The function of BMP4 has been established by previous studies. Shafritz et al. (1996) found overexpression of BMP4 in lymphoblastoid cell lines from 26 of 32 patients with fibrodysplasia ossificans progressiva (FOP; 135100), but from only 1 of 12 normal subjects (P less than 0.001). [4707] Shafritz, A. B.; Shore, E. M.; Gannon, F. H.; Zasloff, M. A.; Taub, R.; Muenke, M.; Kaplan, F. S. : Overexpression of an osteogenic morphogen in fibrodysplasia ossificans progressiva. New Eng. J. Med. 335: 555- 561, 1996. ; and

[4708] Connor, J. M. : Fibrodysplasia ossificans progressiva: lessons from rare maladies. (Editorial) New Eng. J. Med.

335: 591- 593, 1996.

[4709] Further studies establishing the function and utilities of BMP4 are found in John Hopkins OMIM database record ID 112262, and in cited publications listed in Table 5, which are hereby incorporated by reference.Bone morphogenetic protein receptor, type ii (serine/threonine kinase) (BMPR2, Accession NP_001195.2) is another GAM47 target gene, herein designated TARGET GENE. BMPR2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BMPR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMPR2 BINDING SITE, designated SEQ ID:14836, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4710] Another function of GAM47 is therefore inhibition of Bone morphogenetic protein receptor, type ii (serine/threonine kinase) (BMPR2, Accession NP_001195.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMPR2.

[4711] BOCT (Accession NP_065105.2) is another GAM47 target

gene, herein designated TARGET GENE. BOCT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BOCT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BOCT BINDING SITE, designated SEQ ID:18592, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4712] Another function of GAM47 is therefore inhibition of BOCT (Accession NP_065105.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOCT.

[4713] Block of proliferation 1 (BOP1, Accession NP_056016.1) is another GAM47 target gene, herein designated TARGET GENE. BOP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BOP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BOP1 BINDING SITE, designated SEQ ID:13557, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4714] Another function of GAM47 is therefore inhibition of Block of proliferation 1 (BOP1, Accession NP_056016.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP1.

[4715] Bromodomain containing 2 (BRD2, Accession NP_005095.1) is another GAM47 target gene, herein designated TARGET GENE. BRD2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRD2 BINDING SITE, designated SEQ ID:2747, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4716] Another function of GAM47 is therefore inhibition of Bromodomain containing 2 (BRD2, Accession NP_005095.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD2.

[4717] Basic transcription factor 3 (BTF3, Accession NP_001198.2) is another GAM47 target gene, herein designated TARGET GENE. BTF3 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by BTF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTF3 BINDING SITE, designated SEQ ID:14803, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4718] Another function of GAM47 is therefore inhibition of Basic transcription factor 3 (BTF3, Accession NP_001198.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTF3.

[4719] BXDC1 (Accession XP_166303.1) is another GAM47 target gene, herein designated TARGET GENE. BXDC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BXDC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BXDC1 BINDING SITE, designated SEQ ID:577, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4720] Another function of GAM47 is therefore inhibition of

BXDC1 (Accession XP_166303.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BXDC1.

[4721] Chromosome 11 open reading frame 9 (C11orf9, Accession NP_037411.1) is another GAM47 target gene, herein designated TARGET GENE. C11orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C11orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C11orf9 BINDING SITE, designated SEQ ID:5599, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4722] Another function of GAM47 is therefore inhibition of Chromosome 11 open reading frame 9 (C11orf9, Accession NP_037411.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf9.

[4723] C14orf130 (Accession NP_060578.2) is another GAM47 target gene, herein designated TARGET GENE. C14orf130 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded

by C14orf130, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf130 BINDING SITE, designated SEQ ID:9006, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4724] Another function of GAM47 is therefore inhibition of C14orf130 (Accession NP_060578.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf130.

[4725] C14orf132 (Accession NP_064600.1) is another GAM47 target gene, herein designated TARGET GENE. C14orf132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf132 BINDING SITE, designated SEQ ID:3922, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4726] Another function of GAM47 is therefore inhibition of

C14orf132 (Accession NP_064600.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf132.

[4727] C14orf137 (Accession NP_075601.1) is another GAM47 target gene, herein designated TARGET GENE. C14orf137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf137 BINDING SITE, designated SEQ ID:8260, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4728] Another function of GAM47 is therefore inhibition of C14orf137 (Accession NP_075601.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf137.

[4729] C14orf56 (Accession XP_027244.1) is another GAM47 target gene, herein designated TARGET GENE. C14orf56 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C14orf56, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf56 BINDING SITE, designated SEQ ID:529, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4730] Another function of GAM47 is therefore inhibition of C14orf56 (Accession XP_027244.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf56.

[4731] Chromosome 1 open reading frame 34 (C1orf34, Accession XP_027172.1) is another GAM47 target gene, herein designated TARGET GENE. C1orf34 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf34, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:6254, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4732] Another function of GAM47 is therefore inhibition of Chromosome 1 open reading frame 34 (C1orf34, Acces-

sion XP_027172.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34.

[4733] Chromosome 1 open reading frame 6 (C1orf6, Accession NP_064516.1) is another GAM47 target gene, herein designated TARGET GENE. C1orf6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf6 BINDING SITE, designated SEQ ID:8781, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4734] Another function of GAM47 is therefore inhibition of Chromosome 1 open reading frame 6 (C1orf6, Accession NP_064516.1), a gene which may link ataxin- 1 with the chaperone and ubiquitin/proteasome pathways . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf6.

[4735] The function of C1orf6 has been established by previous studies. By a yeast 2- hybrid screen of an adult human brain cDNA library, Davidson et al. (2000) isolated cDNA

clones which they used to assemble a complete cDNA encoding the 601- amino acid ataxin- 1 ubiquitin- like interacting protein (A1U). Sequence comparison revealed that A1U contains an N- terminal ubiquitin- like region, placing it within a large family of similar proteins. In addition, A1U shows substantial homology to human UBQLN2 (OMIM Ref. No. 300264), a protein that binds the ATPase domain of the HSP70- like STCH protein (OMIM Ref. No. 601100). Expression analyses demonstrated that A1U mRNA is widely expressed as a 4.0- kb transcript and is present in Purkinje cells, the primary site of spinocerebellar ataxia- 1 (SCA1; 164400) cerebellar pathology. The A1U protein localized to the nucleus and cytoplasm of transfected COS- 1 cells. Sequences important for the transport of A1U into the nucleus appeared to lie within the C terminus. In the nucleus, A1U colocalized with mutant ataxin- 1 (ATX1; 601556), further demonstrating that A1U interacts with ataxin- 1. Davidson et al. (2000) suggested that A1U may link ataxin- 1 with the chaperone and ubiquitin/proteasome pathways and that ataxin- 1 may function in the formation and regulation of multimeric protein complexes within the nucleus.

[4736]

[4737] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4738] Davidson, J. D.; Riley, B.; Burright, E.N.; Duvick, L.A.; Zoghbi, H.Y.; Orr, H. T. : Identification and characterization of an ataxin- 1- interacting protein: A1Up, a ubiquitin- like nuclear protein. Hum. Molec. Genet. 9: 2305-2312, 2000. ; and

[4739] Fogli, A.; Giglio, S.; Arrigo, G.; Lo Nigro, C.; Zollo, M.; Viggiano, L.; Rocchi, M.; Archidiacono, N.; Zuffardi, O.; Carrozzo, R. : Identification of two paralogous regions mapping to.

[4740] Further studies establishing the function and utilities of C1orf6 are found in John Hopkins OMIM database record ID 605440, and in cited publications listed in Table 5, which are hereby incorporated by reference.Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) is another GAM47 target gene, herein designated TARGET GENE. C1QR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:8931, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4741] Another function of GAM47 is therefore inhibition of Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1.

[4742] C1q and tumor necrosis factor related protein 6 (C1QTNF6, Accession NP_114116.2) is another GAM47 target gene, herein designated TARGET GENE. C1QTNF6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QTNF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:621, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4743] Another function of GAM47 is therefore inhibition of C1q and tumor necrosis factor related protein 6 (C1QTNF6, Accession NP_114116.2) . Accordingly, utilities of GAM47

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6.

[4744] Chromosome 20 open reading frame 110 (C20orf110, Accession XP_086728.2) is another GAM47 target gene, herein designated TARGET GENE. C20orf110 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf110, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:4643, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4745] Another function of GAM47 is therefore inhibition of Chromosome 20 open reading frame 110 (C20orf110, Accession XP_086728.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110.

[4746] Chromosome 20 open reading frame 150 (C20orf150, Accession XP_037265.1) is another GAM47 target gene, herein designated TARGET GENE. C20orf150 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf150, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf150 BINDING SITE, designated SEQ ID:12630, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4747] Another function of GAM47 is therefore inhibition of Chromosome 20 open reading frame 150 (C20orf150, Accession XP_037265.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf150.

[4748] Chromosome 20 open reading frame 177 (C20orf177, Accession XP_290955.1) is another GAM47 target gene, herein designated TARGET GENE. C20orf177 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf177 BINDING SITE, designated SEQ ID:893, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4749] Another function of GAM47 is therefore inhibition of

Chromosome 20 open reading frame 177 (C20orf177, Accession XP_290955.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf177.

[4750] Chromosome 20 open reading frame 29 (C20orf29, Accession NP_060817.1) is another GAM47 target gene, herein designated TARGET GENE. C20orf29 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf29 BINDING SITE, designated SEQ ID:13011, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4751] Another function of GAM47 is therefore inhibition of Chromosome 20 open reading frame 29 (C20orf29, Accession NP_060817.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf29.

[4752] Chromosome 20 open reading frame 9 (C20orf9, Accession NP_057088.1) is another GAM47 target gene, herein designated TARGET GENE. C20orf9 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by C20orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf9 BINDING SITE, designated SEQ ID:4613, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4753] Another function of GAM47 is therefore inhibition of Chromosome 20 open reading frame 9 (C20orf9, Accession NP_057088.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf9.

[4754] Chromosome 21 open reading frame 85 (C21orf85, Accession NP_715634.1) is another GAM47 target gene, herein designated TARGET GENE. C21orf85 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C21orf85, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf85 BINDING SITE, designated SEQ ID:3085, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA,

also designated SEQ ID:269.

[4755] Another function of GAM47 is therefore inhibition of Chromosome 21 open reading frame 85 (C21orf85, Accession NP_715634.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf85.

[4756] Chromosome 21 open reading frame 88 (C21orf88, Accession NP_715635.1) is another GAM47 target gene, herein designated TARGET GENE. C21orf88 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf88, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf88 BINDING SITE, designated SEQ ID:7197, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4757] Another function of GAM47 is therefore inhibition of Chromosome 21 open reading frame 88 (C21orf88, Accession NP_715635.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf88.

[4758] Chromosome 5 open reading frame 7 (C5orf7, Accession

NP_057688.1) is another GAM47 target gene, herein designated TARGET GENE. C5orf7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C5orf7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf7 BINDING SITE, designated SEQ ID:13501, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4759] Another function of GAM47 is therefore inhibition of Chromosome 5 open reading frame 7 (C5orf7, Accession NP_057688.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf7.

[4760] Chromosome 6 open reading frame 33 (C6orf33, Accession NP_588608.1) is another GAM47 target gene, herein designated TARGET GENE. C6orf33 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:14931, to the nucleotide se-

quence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4761] Another function of GAM47 is therefore inhibition of Chromosome 6 open reading frame 33 (C6orf33, Accession NP_588608.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33.

[4762] C6orf50 (Accession XP_166460.1) is another GAM47 target gene, herein designated TARGET GENE. C6orf50 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf50, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf50 BINDING SITE, designated SEQ ID:3566, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4763] Another function of GAM47 is therefore inhibition of C6orf50 (Accession XP_166460.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf50.

[4764] C6orf67 (Accession NP_060717.1) is another GAM47 target gene, herein designated TARGET GENE. C6orf67 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf67, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf67 BINDING SITE, designated SEQ ID:10872, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4765] Another function of GAM47 is therefore inhibition of C6orf67 (Accession NP_060717.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf67.

[4766] Carbonic anhydrase x (CA10, Accession NP_064563.1) is another GAM47 target gene, herein designated TARGET GENE. CA10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CA10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CA10 BINDING SITE, designated SEQ ID:9177, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4767] Another function of GAM47 is therefore inhibition of Car-

bonic anhydrase x (CA10, Accession NP_064563.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA10.

[4768] Chaperone, abc1 activity of bc1 complex like (s. pombe) (CABC1, Accession NP_064632.1) is another GAM47 target gene, herein designated TARGET GENE. CABC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CABC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CABC1 BINDING SITE, designated SEQ ID:2169, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4769] Another function of GAM47 is therefore inhibition of Chaperone, abc1 activity of bc1 complex like (s. pombe) (CABC1, Accession NP_064632.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABC1.

[4770] Calcium channel, voltage-dependent, gamma subunit 4 (CACNG4, Accession NP_055220.1) is another GAM47 target gene, herein designated TARGET GENE. CACNG4

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CACNG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CACNG4 BINDING SITE, designated SEQ ID:9768, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4771] Another function of GAM47 is therefore inhibition of Calcium channel, voltage-dependent, gamma subunit 4 (CACNG4, Accession NP_055220.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG4.

[4772] Calneuron 1 (CALN1, Accession NP_113656.1) is another GAM47 target gene, herein designated TARGET GENE. CALN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:9427, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4773] Another function of GAM47 is therefore inhibition of Caln-neuron 1 (CALN1, Accession NP_113656.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1.

[4774] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705720.1) is another GAM47 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:10400, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4775] Another function of GAM47 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705720.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[4776] Calcium/calmodulin-dependent protein kinase kinase 2,

beta (CAMKK2, Accession NP_006540.3) is another GAM47 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:10400, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4777] Another function of GAM47 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_006540.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[4778] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757380.1) is another GAM47 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:10400, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4779] Another function of GAM47 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757380.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[4780] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705719.2) is another GAM47 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:10400, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4781] Another function of GAM47 is therefore inhibition of Cal-

cium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705719.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[4782] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757365.1) is another GAM47 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:10400, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4783] Another function of GAM47 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757365.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[4784] Capping protein (actin filament), gelsolin-like (CAPG, Accession NP_001738.1) is another GAM47 target gene,

herein designated TARGET GENE. CAPG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAPG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAPG BINDING SITE, designated SEQ ID:15413, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4785] Another function of GAM47 is therefore inhibition of Capping protein (actin filament), gelsolin-like (CAPG, Accession NP_001738.1), a gene which reis a macrophage capping protein which versibly blocks the barbed ends of actin filaments but does not sever preformed actin filaments. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPG.

[4786] The function of CAPG has been established by previous studies. For a nonmuscle cell to change shape during movement, the actin filament network in the cell periphery must undergo a marked reorganization. The gelsolin family of proteins profoundly affects the architecture of actin filaments, rapidly modulating the actin structures in re-

sponse to external stimuli. These proteins are able to sever, nucleate, and/or cap actin filaments in a Ca(2+)- and phosphoinositide- regulated manner. Gelsolin (GSN; 137350), the founding member of the family, is found in nearly all cells. Villin (VIL1; 193040) has a slightly higher molecular weight than gelsolin and a very restricted tissue distribution, being found only in intestinal microvilli and renal tubular epithelial cells. Southwick and DiNubile (1986) found another mammalian member of the gelsolin family. This protein, first purified from rabbit alveolar macrophages, was named macrophage capping protein. The protein was subsequently renamed Cap G (gene symbol CAPG). 'Cap' was chosen because unlike other members of the gelsolin/villin family, this protein caps the barbed ends of actin filaments but does not sever them. 'G' was included in the name because the derived amino acid sequence of Cap G most closely resembles gelsolin, possessing 49% identity with its amino terminal half. Dabiri et al. (1992) cloned and sequenced the human cDNA for CAPG. The CAPG gene is 16.6 kb long and contains 10 exons and 9 introns. By PCR analysis of somatic cell hybrid DNAs and fluorescence in situ hybridization, Mishra et al. (1994) found that the CAPG gene is located

on the proximal part of the long arm of chromosome 2.

[4787]

[4788] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4789] Southwick, F. S.; DiNubile, M. J. : Rabbit alveolar macrophages contain a Ca(2+)- sensitive, 41,000- Dalton protein which reversibly blocks the 'barbed' ends of actin filaments but does not sever them. J. Biol. Chem. 261: 14191- 14195, 1986. ; and

[4790] Mishra, V. S.; Henske, E. P.; Kwiatkowski, D. J.; Southwick, F. S. : The human actin- regulatory protein cap G: gene structure and chromosome location. Genomics 23: 560-565, 1994.

[4791] Further studies establishing the function and utilities of CAPG are found in John Hopkins OMIM database record ID 153615, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cerebellin 1 precursor (CBLN1, Accession NP_004343.1) is another GAM47 target gene, herein designated TARGET GENE. CBLN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CBLN1, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBLN1 BINDING SITE, designated SEQ ID:10839, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4792] Another function of GAM47 is therefore inhibition of Cerebellin 1 precursor (CBLN1, Accession NP_004343.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLN1.

[4793] Chemokine (c-c motif) ligand 2 (CCL2, Accession NP_002973.1) is another GAM47 target gene, herein designated TARGET GENE. CCL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCL2 BINDING SITE, designated SEQ ID:10130, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4794] Another function of GAM47 is therefore inhibition of Chemokine (c-c motif) ligand 2 (CCL2, Accession NP_002973.1) . Accordingly, utilities of GAM47 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CCL2.

[4795] Cyclin d2 (CCND2, Accession NP_001750.1) is another GAM47 target gene, herein designated TARGET GENE. CCND2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:18032, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4796] Another function of GAM47 is therefore inhibition of Cyclin d2 (CCND2, Accession NP_001750.1), a gene which is essential for the control of the cell cycle at the g1/s (start) transition. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2.

[4797] The function of CCND2 has been established by previous studies. Inaba et al. (1992) used murine cDNA clones for 3 cyclin D genes that are normally expressed during the G1 phase of the cell cycle to clone the cognate human genes. By analysis of somatic cell hybrids containing different

human chromosomes and by fluorescence in situ hybridization, they assigned the gene for cyclin D2 (CCND2) to 12p13. (Since the CCND1 gene (OMIM Ref. No. 168461) is on 11q13, this may be another bit of evidence of the homology of chromosomes 11 and 12.) Xiong et al. (1992) reported the cloning of the CCND2 gene and its assignment to 12p13 by fluorescence in situ hybridization. A pseudogene of CCND2 was mapped to 11q13 by Inaba et al. (1992). Kim et al. (2000) used Ccnd1- and Ccnd2- deficient mice to investigate the role of cyclins in Schwann cell growth. They concluded that neither Ccnd1 nor Ccnd2 is specifically required for the initial growth and maturation of Schwann cells during mouse development (see OMIM Ref. No. CCND1; 168461).

[4798]

[4799] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4800] Inaba, T.; Matsushime, H.; Valentine, M.; Roussel, M. F.; Sherr, C. J.; Look, A. T. : Genomic organization, chromosomal localization, and independent expression of human cyclin D genes. Genomics 13: 565- 574, 1992. ; and

[4801] Kim, H. A.; Pomeroy, S. L.; Whoriskey, W.; Pawlitzky, I.;

Benowitz, L. I.; Sicinski, P.; Stiles, C. D.; Roberts, T. M. : A developmentally regulated switch directs regenerative growth o.

[4802] Further studies establishing the function and utilities of CCND2 are found in John Hopkins OMIM database record ID 123833, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cyclin e1 (CCNE1, Accession NP_001229.1) is another GAM47 target gene, herein designated TARGET GENE. CCNE1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCNE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNE1 BINDING SITE, designated SEQ ID:11860, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4803] Another function of GAM47 is therefore inhibition of Cyclin e1 (CCNE1, Accession NP_001229.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNE1.

[4804] Cyclin e1 (CCNE1, Accession NP_476530.1) is another

GAM47 target gene, herein designated TARGET GENE. CCNE1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCNE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNE1 BINDING SITE, designated SEQ ID:11860, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4805] Another function of GAM47 is therefore inhibition of Cyclin e1 (CCNE1, Accession NP_476530.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNE1.

[4806] Chemokine (c-c motif) receptor 7 (CCR7, Accession NP_001829.1) is another GAM47 target gene, herein designated TARGET GENE. CCR7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCR7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR7 BINDING SITE, designated SEQ ID:13600, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[4807] Another function of GAM47 is therefore inhibition of Chemokine (c-c motif) receptor 7 (CCR7, Accession NP_001829.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR7.

[4808] Cdc42 effector protein (rho gtpase binding) 5 (CDC42EP5, Accession NP_659494.2) is another GAM47 target gene, herein designated TARGET GENE. CDC42EP5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CDC42EP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC42EP5 BINDING SITE, designated SEQ ID:18102, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4809] Another function of GAM47 is therefore inhibition of Cdc42 effector protein (rho gtpase binding) 5 (CDC42EP5, Accession NP_659494.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42EP5.

[4810] Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Acces-

sion NP_004351.1) is another GAM47 target gene, herein designated TARGET GENE. CDH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:6768, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4811] Another function of GAM47 is therefore inhibition of Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NP_004351.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1.

[4812] Glycoprotein hormones, alpha polypeptide (CGA, Accession NP_000726.1) is another GAM47 target gene, herein designated TARGET GENE. CGA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CGA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGA BINDING SITE, designated SEQ ID:4642, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[4813] Another function of GAM47 is therefore inhibition of Glycoprotein hormones, alpha polypeptide (CGA, Accession NP_000726.1), a gene which is a precursor of the alpha subunit of chorionic gonadotropin hormone. and therefore may be associated with Secondary infertility . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Secondary infertility ., and of other diseases and clinical conditions associated with CGA.

[4814] The function of CGA has been established by previous studies. By in situ hybridization, Trent (1982) concluded that chromosome 18 carries the (an) HCG locus. That the alpha subunit of all 4 glycoprotein hormones is coded by a single gene was demonstrated by Fiddes and Goodman (1981) and Boothby et al. (1981). The 5- prime untranslated portion bears sequence homology to the corresponding part of the growth hormone gene. By use of restriction probes in human- rodent hybrids, Naylor et al. (1983) assigned the alpha subunit to chromosome 6 and the beta subunit to chromosome 19. Special attention was paid to the exclusion of chromosomes 10 and 18 as sites of these genes. CGA mapped to the 6q12- 6q21 region. The alpha and beta genes are on mouse chromosomes 4

and 7, respectively. Mouse 7 carries 2 other homologs of human 19: Pep- 7 and Gpi (homologous to PEPD and GPI). Hardin et al. (1983), by Southern blot analysis of DNA from somatic cell hybrids and by in situ hybridization, concluded that the alpha- HCG gene is on chromosome 18 (p11). A full- length cDNA probe for the alpha subunit was used in these studies. The reason for the discrepancy with the studies that place the alpha subunit on chromosome 6 is unknown. Hoshina et al. (1984) found at least 2 polymorphic sites in its 3- prime flanking region detected by restriction enzymes HindIII and EcoRI. In family studies, as expected, only a paternal genetic contribution was found in most hydatidiform moles. However, one uncommon pattern of DNA polymorphism, homozygosity for absent EcoRI site and presence of the HindIII site, predominated in choriocarcinoma. Thus, the authors suggested that moles with this uncommon pattern are particularly prone to development of choriocarcinoma. Amato et al. (2002) reported a patient with a 9- year history of secondary infertility due to an anti- CG autoantibody. Although she had regular menstrual cycles, had conceived spontaneously, and had good hormonal and follicular responses to gonadotropic stimulation regimens during the

in vitro fertilization workup, she presented with apparent recurrent pregnancy loss associated with prolonged raised CG levels. She was found to have specific, low- affinity, but high- capacity anti- CG antibody. Crossreaction with recombinant FSH, recombinant LH, CG- alpha, and CG-beta was low. In addition, heat- inactivated serum and the affinity- purified IgG were shown to inhibit the action of CG in an in vitro bioassay. The authors concluded that the persisting titer of the antibody was responsible for the patient's infertility.

[4815]

[4816] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4817] Amato, F.; Warnes, G. M.; Kirby, C. A.; Norman, R. J. : In-fertility caused by hCG autoantibody. J. Clin. Endocr. Metab. 87: 993- 997, 2002. ; and

[4818] Fiddes, J. C.; Goodman, H. M. : The gene encoding the common alpha subunit of the four human glycoprotein hormones. J. Molec. Appl. Genet. 1: 3- 18, 1981.

[4819] Further studies establishing the function and utilities of CGA are found in John Hopkins OMIM database record ID 118850, and in cited publications listed in Table 5, which

are hereby incorporated by reference.CGI-115 (Accession NP_057136.1) is another GAM47 target gene, herein designated TARGET GENE. CGI-115 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CGI-115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-115 BINDING SITE, designated SEQ ID:5086, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4820] Another function of GAM47 is therefore inhibition of CGI-115 (Accession NP_057136.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-115.

[4821] CGI-30 (Accession NP_057042.1) is another GAM47 target gene, herein designated TARGET GENE. CGI-30 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CGI-30, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-30 BINDING SITE, designated SEQ ID:4236, to the nucleotide se-

quence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4822] Another function of GAM47 is therefore inhibition of CGI-30 (Accession NP_057042.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-30.

[4823] Choline kinase-like (CHKL, Accession NP_689466.1) is another GAM47 target gene, herein designated TARGET GENE. CHKL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CHKL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHKL BINDING SITE, designated SEQ ID:4091, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4824] Another function of GAM47 is therefore inhibition of Choline kinase-like (CHKL, Accession NP_689466.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHKL.

[4825] Chromatin accessibility complex 1 (CHRAC1, Accession

NP_059140.1) is another GAM47 target gene, herein designated TARGET GENE. CHRAC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHRAC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:15944, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4826] Another function of GAM47 is therefore inhibition of Chromatin accessibility complex 1 (CHRAC1, Accession NP_059140.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1.

[4827] Cytokine inducible sh2-containing protein (CISH, Accession NP_659508.1) is another GAM47 target gene, herein designated TARGET GENE. CISH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CISH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CISH

BINDING SITE, designated SEQ ID:1811, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4828] Another function of GAM47 is therefore inhibition of Cytokine inducible sh2-containing protein (CISH, Accession NP_659508.1), a gene which intervenes in the negative regulation of cytokines. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CISH.

[4829] The function of CISH has been established by previous studies. As part of the search for immediate- early cytokine- responsive genes, Yoshimura et al. (1995) cloned murine Cish, which was shown to have a growth inhibitory function. Cis, the protein product of Cish, has a Src homology 2 (SH2) domain in the middle of its sole structural motif. Tight linkage of Cish to the Gnai2 gene (OMIM Ref. No. 139360) on mouse chromosome 9, a region syntenic to human 3p21, prompted Uchida et al. (1997) to isolate a human CISH cDNA and map the gene to 3p21.3 by fluorescence in situ hybridization. Northern blot analysis showed expression of CISH as a 2- kb transcript in various epithelial tissues, including lung and kidney, which develop tumors frequently exhibiting 3p21.3 deletions.

The CISH gene contains 2 introns, about 3 kb and 0.4 kb in size, and has 3 repeats of the pentameric mRNA destabilization signal, ATTTA, in its 3- prime untranslated region. The CIS protein consists of 258 amino acids.

[4830]

[4831] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4832] Uchida, K.; Yoshimura, A.; Inazawa, J.; Yanagisawa, K.; Osada, H.; Masuda, A.; Saito, T.; Takahashi, T.; Miyajima, A.; Takahashi, T. : Molecular cloning of CISH, chromosome assignment to 3p21.3, and analysis of expression in fetal and adult tissues. Cytogenet. Cell Genet. 78: 209- 212, 1997. ; and

[4833] Yoshimura, A.; Ohkubo, T.; Kiguchi, T.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Hara, T.; Miyajima, A. : A novel cytokine- inducible gene CIS, encodes an SH2- containing protein.

[4834] Further studies establishing the function and utilities of CISH are found in John Hopkins OMIM database record ID 602441, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cytokine inducible sh2-containing protein (CISH, Accession NP_037456.4) is

another GAM47 target gene, herein designated TARGET GENE. CISH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CISH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CISH BINDING SITE, designated SEQ ID:1811, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4835] Another function of GAM47 is therefore inhibition of Cytokine inducible sh2-containing protein (CISH, Accession NP_037456.4), a gene which intervenes in the negative regulation of cytokines. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CISH.

[4836] The function of CISH has been established by previous studies. As part of the search for immediate- early cytokine- responsive genes, Yoshimura et al. (1995) cloned murine Cish, which was shown to have a growth inhibitory function. Cis, the protein product of Cish, has a Src homology 2 (SH2) domain in the middle of its sole structural motif. Tight linkage of Cish to the Gnai2 gene (OMIM Ref.

No. 139360) on mouse chromosome 9, a region syntenic to human 3p21, prompted Uchida et al. (1997) to isolate a human CISH cDNA and map the gene to 3p21.3 by fluorescence in situ hybridization. Northern blot analysis showed expression of CISH as a 2- kb transcript in various epithelial tissues, including lung and kidney, which develop tumors frequently exhibiting 3p21.3 deletions. The CISH gene contains 2 introns, about 3 kb and 0.4 kb in size, and has 3 repeats of the pentameric mRNA destabilization signal, ATTTA, in its 3- prime untranslated region. The CIS protein consists of 258 amino acids.

[4837]

[4838] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4839] Uchida, K.; Yoshimura, A.; Inazawa, J.; Yanagisawa, K.; Osada, H.; Masuda, A.; Saito, T.; Takahashi, T.; Miyajima, A.; Takahashi, T. : Molecular cloning of CISH, chromosome assignment to 3p21.3, and analysis of expression in fetal and adult tissues. Cytogenet. Cell Genet. 78: 209- 212, 1997. ; and

[4840] Yoshimura, A.; Ohkubo, T.; Kiguchi, T.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Hara, T.; Miyajima, A. : A

novel cytokine- inducible gene CIS, encodes an SH2- containing protein.

[4841] Further studies establishing the function and utilities of CISH are found in John Hopkins OMIM database record ID 602441, and in cited publications listed in Table 5, which are hereby incorporated by reference.Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XP_045786.2) is another GAM47 target gene, herein designated TARGET GENE. CIT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CIT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:9863, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4842] Another function of GAM47 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XP_045786.2), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT.

[4843] The function of CIT has been established by previous studies. Activated Rho GTPases (see OMIM Ref. No. 602924) trigger distinctive kinase cascades. In particular, ROCK (see OMIM Ref. No. ROCK1, 601702) binds to Rho, and its kinase activity is moderately stimulated by this association. The citron molecule (Madaule et al., 1995), a specific interactor of Rho and Rac (see OMIM Ref. No. 602048), shares a significant degree of structural homology with ROCK; however, its lack of a kinase domain raised the question of its biologic function. By PCR of a mouse primary keratinocyte cDNA library, Di Cunto et al. (1998) identified a novel serine/threonine kinase, CRIK (citron Rho- interacting kinase), belonging to the myotonic dystrophy kinase (see OMIM Ref. No. 605377) family. CRIK can be expressed as at least 2 isoforms, one of which encompasses the previously reported form of citron in almost its entirety. The long form of CRIK is a 240- kD protein in which the kinase domain is followed by the sequence of citron. The short form, CRIK- SK (short kinase), is an approximately 54- kD protein that consists mostly of the kinase domain. CRIK and CRIK- SK proteins are capable of phosphorylating exogenous substrates as well as of autophosphorylation, when tested by in vitro kinase as-

says after expression into COS- 7 cells. CRIK kinase activity is increased several- fold by coexpression of constitutively active Rho, while active Rac has more limited effects. Kinase activity of the endogenous CRIK is indicated by in vitro kinase assays after immunoprecipitation with antibodies recognizing the citron moiety of the protein. When expressed in keratinocytes, full- length CRIK, but not CRIK- SK, localizes into corpuscular cytoplasmic structures and elicits recruitment of actin into these structures. The previously reported Rho- associated kinases ROCK1 and ROCK2 (OMIM Ref. No. 604002) are ubiquitously expressed. Northern blot analysis of mouse tissues revealed a restricted pattern of expression limited to keratinocytes, brain, spleen, lung, kidney, and an especially strong signal in testis. No expression was detectable in heart, liver, or skeletal muscle. The CRIK protein contains a kinase domain, a coiled- coil domain, a leucine- rich domain, a Rho- Rac binding domain, a zinc finger region, a pleckstrin homology domain, and a putative SH3- binding domain. Di Cunto et al. (1998) reported cloning the human homolog of the CRIK kinase domain. They stated that the human homolog of citron is contained within a PAC clone (GenBank AC002563) mapping to chromosome 12q.

[4844] Animal model experiments lend further support to the function of CIT. Di Cunto et al. (2000) generated mice deficient in citron kinase by targeted disruption. Citron- K -/- mice grow at slower rates, are severely ataxic, and die before adulthood as a consequence of fatal seizures. Their brains display defective neurogenesis, with dramatic depletion of microneurons in the olfactory bulb, hippocampus, and cerebellum. These abnormalities arise during development of the central nervous system due to altered cytokinesis and massive apoptosis. Di Cunto et al. (2000) concluded that citron- K is essential for cytokinesis in vivo, in specific neuronal precursors only. Moreover, they suggested a novel molecular mechanism for a subset of human malformation syndromes of the central nervous system.

[4845] It is appreciated that the abovementioned animal model for CIT is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4846] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4847] Di Cunto, F.; Imarisio, S.; Hirsch, E.; Broccoli, V.; Bulfone,

A.; Migheli, A.; Atzori, C.; Turco, E.; Triolo, R.; Dotto, G. P.; Silengo, L.; Altruda, F. : Defective neurogenesis in citron kinase knockout mice by altered cytokinesis and massive apoptosis. Neuron 28: 115- 127, 2000. ; and

[4848] Madaule, P.; Furuyashiki, T.; Reid, T.; Ishizaki, T.; Watanabe, G.; Morii, N.; Narumiya, S. : A novel partner for the GTP- bound forms of rho and rac. FEBS Lett. 377: 243-248, 1995.

[4849] Further studies establishing the function and utilities of CIT are found in John Hopkins OMIM database record ID 605629, and in cited publications listed in Table 5, which are hereby incorporated by reference.C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2) is another GAM47 target gene, herein designated TARGET GENE. CLECSF12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLECSF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE, designated SEQ ID:11168, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4850] Another function of GAM47 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 12 (CLECSF12, Accession NP_072092.2), a gene which is a pattern- recognition receptor . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF12.

[4851] The function of CLECSF12 has been established by previous studies. Yokota et al. (2001) cloned human dectin- 1 using degenerative PCR amplification of mRNA isolated from dendritic cells and subsequent cDNA cloning. The human dectin- 1 gene encodes a polypeptide of 247 amino acids, 3 amino acids longer than the mouse protein. Dectin- 1 contains an immunoreceptor tyrosine-based activation motif within the cytoplasmic domain. Human dectin- 1 mRNA is expressed predominantly in peripheral blood leukocytes and preferentially by dendritic cells. The mRNA encodes a 33- kD glycoprotein. In human epidermis, the protein is expressed selectively by Langerhans cells, which are an epidermal subset of dendritic cells. A truncated form of dectin- 1 RNA encodes a polypeptide lacking almost the entire neck domain, which is required for accessibility of the carbohydrate recogni-

tion domain to ligands. Truncated dectin is produced by alternative splicing. Brown and Gordon (2001) identified dectin- 1 as a beta- glucan receptor present on macrophages. In contrast to its reported specificity for dendritic cells (Yokota et al. (2001), Brown and Gordon (2001)) found that dectin- 1 was expressed in every macrophage population examined and in more tissues than was previously reported with the highest expression being in the liver, lung, and thymus. Brown and Gordon (2001) found that dectin- 1 is a pattern- recognition receptor that recognizes a variety of beta- 1,3- linked and beta- 1,6- linked glucans from fungi and plants. Dectin-1 did not recognize monosaccharides or carbohydrates with different linkages. Laminarin and glucan phosphate, a structurally defined immunologically active beta- glucan, were the most effective inhibitors; both bind to the beta- glucan receptor on monocytes and macrophages. Soluble recombinant dectin- 1 stimulates the proliferation of T lymphocytes (Ariizumi et al. (2000)). In a whole- cell binding assay, binding of T cells to NIH 3T3 cells expressing dectin- 1 was not inhibited by beta- glucans. Therefore, Brown and Gordon (2001) concluded that dectin- 1 has 2 ligand binding sites: one that recognizes an en-

dogenous ligand on T cells, and another for exogenous carbohydrates.

[4852]

[4853] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4854] Ariizumi, K.; Shen, G.- L.; Shikano, S.; Xu, S.; Ritter, R., III; Kumamoto, T.; Edelbaum, D.; Morita, A.; Bergstresser, P. R.; Takashima, A. : Identification of a novel, dendritic cell-associated molecule, dectin- 1, by subtractive cDNA cloning. J. Biol. Chem. 275: 20157- 20167, 2000. ; and

[4855] Brown, G. D.; Gordon, S. : A new receptor for beta- glucans. Nature 413: 36- 37, 2001.

[4856] Further studies establishing the function and utilities of CLECSF12 are found in John Hopkins OMIM database record ID 606264, and in cited publications listed in Table 5, which are hereby incorporated by reference.C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 5 (CLECSF5, Accession NP_037384.1) is another GAM47 target gene, herein designated TARGET GENE. CLECSF5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLECSF5, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:2913, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4857] Another function of GAM47 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 5 (CLECSF5, Accession NP_037384.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5.

[4858] C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 9 (CLECSF9, Accession NP_055173.1) is another GAM47 target gene, herein designated TARGET GENE. CLECSF9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLECSF9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLECSF9 BINDING SITE, designated SEQ ID:8709, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated

SEQ ID:269.

[4859] Another function of GAM47 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) lectin, superfamily member 9 (CLECSF9, Accession NP_055173.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF9.

[4860] Chloride intracellular channel 6 (CLIC6, Accession NP_444507.1) is another GAM47 target gene, herein designated TARGET GENE. CLIC6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLIC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLIC6 BINDING SITE, designated SEQ ID:2170, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4861] Another function of GAM47 is therefore inhibition of Chloride intracellular channel 6 (CLIC6, Accession NP_444507.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC6.

[4862] Calsyntenin 2 (CLSTN2, Accession NP_071414.1) is an-

other GAM47 target gene, herein designated TARGET GENE. CLSTN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLSTN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLSTN2 BINDING SITE, designated SEQ ID:15486, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4863] Another function of GAM47 is therefore inhibition of Calsyntenin 2 (CLSTN2, Accession NP_071414.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN2.

[4864] Cyclin m4 (CNNM4, Accession NP_064569.1) is another GAM47 target gene, herein designated TARGET GENE. CNNM4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNNM4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ ID:14167, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[4865] Another function of GAM47 is therefore inhibition of Cyclin m4 (CNNM4, Accession NP_064569.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM4.

[4866] Coatomer protein complex, subunit alpha (COPA, Accession NP_004362.1) is another GAM47 target gene, herein designated TARGET GENE. COPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COPA BINDING SITE, designated SEQ ID:5791, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4867] Another function of GAM47 is therefore inhibition of Coatomer protein complex, subunit alpha (COPA, Accession NP_004362.1), a gene which is invovled protein transport between the endoplasmic reticulum (ER) and Golgi compartments. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPA.

[4868] The function of COPA has been established by previous studies. In eukaryotic cells, protein transport between the endoplasmic reticulum (ER) and Golgi compartments is mediated in part by non- clathrin- coated vesicular coat proteins (COPs). Seven COP subunits have been recognized, and represent components of a complex known as coatomer, or COPI. The subunits are designated alpha-COP, beta- COP (OMIM Ref. No. 600959), beta- prime-COP, gamma- COP, delta- COP (OMIM Ref. No. 600820), epsilon- COP (OMIM Ref. No. 606942), and zeta- COP COPI is a heptameric protein recruited to membranes by ARF1 (OMIM Ref. No. 103180), a GTP- binding protein. Coat assembly helps in the transport of budding off membrane between the ER and Golgi apparatus. Using fluorescence microscopy, Presley et al. (2002) showed that guanine nucleotide exchange- activated ARF1 at the Golgi membrane recruits and binds cytoplasmic COPI to the membranes. Photobleaching experiments demonstrated that COPI remains at the membranes after ARF1 has been hydrolysed by GTPase- activating protein (GAP; 139150). COPI binds to membrane cargo, soluble- cargo receptors, or other Golgi proteins. Uncoating, or the release of COPI from Golgi membranes to the cytoplasm, then occurs,

which is inhibited by AIF (PDCD8; 300169). Presley et al. (2002) concluded from their kinetic and biochemical analyses that COPI and ARF1 continuously bind and release from Golgi membranes, allowing the membrane at these sites to recruit cargo, alter their phospholipid composition, and become larger, phase- separated domains Chow (1997) reported the genomic organization of the COPA gene. It contains 33 exons ranging in size from 67 to 611 bp. All exon- intron junctions conform with the GT- AG rule. The 32 introns range from about 80 bp to 4 kb, with the genomic DNA of COPA estimated to span approximately 37 kb. The untranscribed and noncoding portions of the 5- prime end of the gene lacked TATA and CAAT boxes but displayed a high GC content, consistent with its being a housekeeping gene

[4869]

[4870] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4871] Presley, J. F.; Ward, T. H.; Pfeifer, A. C.; Siggia, E. D.; Phair, R. D.; Lippincott- Schwartz, J. : Dissection of COPI and Arf1 dynamics in vivo and role in Golgi membrane transport. Nature 417: 187- 193, 2002. ; and

[4872] Quek, H. H.; Chow, V. T. K. : Genomic organization and mapping of the human HEP- COP gene (COPA) to 1q. Cytogenet. Cell Genet. 76: 139- 143, 1997.

[4873] Further studies establishing the function and utilities of COPA are found in John Hopkins OMIM database record ID 601924, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689453.1) is another GAM47 target gene, herein designated TARGET GENE. CPT1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CPT1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPT1B BINDING SITE, designated SEQ ID:4091, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4874] Another function of GAM47 is therefore inhibition of Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689453.1), a gene which is a rate- controlling enzyme of long- chain fatty acid b- oxidation pathway. Accordingly, utilities of GAM47 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CPT1B.

[4875] The function of CPT1B has been established by previous studies. The mitochondrial carnitine palmitoyltransferases (CPTs; EC 2.3.1.21) are required to allow net transport of long- chain fatty acyl- CoAs from the cytoplasm into the mitochondria. Type I CPT (see OMIM Ref. No. CPT1A; 600528) resides in the outer mitochondrial membrane. At least 2 isoforms of type I CPT are expressed in human and rat. Yamazaki et al. (1996) used a cDNA probe for the rat muscle- type CPT I to isolate cDNA clones for the human homolog. By Northern analysis, they determined that this isoform is expressed primarily in heart and skeletal mus- cle Van der Leij et al. (1997) isolated and sequenced cDNA and genomic DNA fragments of the human CPT1B gene, encoding muscle type carnitine palmitoyltransferase I. Analysis of CPT1B cDNA sequences revealed the presence of an untranslated 5- prime exon and differential pro- cessing of introns 13 and 19. The alternative splicing of intron 13 caused an in- frame deletion leading to a pro- tein smaller by 10 amino acids. By using different splice acceptor sites, van der Leij et al. (1997) found that intron 19 was spliced in most cases, but 4 of 14 sequenced

CPT1B 3- prime cDNA clones contained part of intron 19 instead of exon 20

[4876]

[4880] Further studies establishing the function and utilities of CPT1B are found in John Hopkins OMIM database record ID 601987, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cofactor required for sp1 transcriptional activation, subunit 2, 150kda (CRSP2, Accession NP_004220.2) is another GAM47 target gene, herein designated TARGET GENE. CRSP2 BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by CRSP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRSP2 BINDING SITE, designated SEQ ID:14259, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4881] Another function of GAM47 is therefore inhibition of Co-factor required for sp1 transcriptional activation, subunit 2, 150kda (CRSP2, Accession NP_004220.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRSP2.

[4882] Cysteine sulfinic acid decarboxylase (CSAD, Accession NP_057073.2) is another GAM47 target gene, herein designated TARGET GENE. CSAD BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CSAD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSAD BINDING SITE, designated SEQ ID:12878, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4883] Another function of GAM47 is therefore inhibition of Cysteine sulfinic acid decarboxylase (CSAD, Accession NP_057073.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSAD.

[4884] Cug triplet repeat, rna binding protein 1 (CUGBP1, Accession NP_006551.1) is another GAM47 target gene, herein designated TARGET GENE. CUGBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CUGBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CUGBP1 BINDING SITE, designated SEQ ID:7087, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4885] Another function of GAM47 is therefore inhibition of Cug triplet repeat, rna binding protein 1 (CUGBP1, Accession NP_006551.1), a gene which regulates splicing and translation of various rnas. and therefore may be associated with Myotonic dystrophy. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Myotonic dystrophy, and of other diseases and clinical conditions

associated with CUGBP1.

[4886] The function of CUGBP1 has been established by previous studies. While an unstable CTG triplet repeat expansion is responsible for myotonic dystrophy (DM; 160900), the mechanism whereby this genetic defect induces the disease is unknown. To detect proteins that bind to CTG triplet repeats, Timchenko et al. (1996) performed band-shift analysis using as probes double- stranded DNA fragments having CTG repeats and single- stranded oligonucleotides having CTG repeats or RNA CUG repeats. The proteins were derived from nuclear and cytoplasmic extracts of HeLa cells, fibroblasts, and myotubes. Proteins binding to the double- stranded DNA repeat were inhibited by the nonlabeled repeat but not by a nonspecific DNA fragment. Another protein binding to the single-stranded CTG probe and the RNA CUG probe was inhibited by nonlabeled CTG(8) and CUG(8) repeats. The protein binding only to the RNA repeat (CUG)8 was inhibited by nonlabeled (CUG)8 but not by nonlabeled single- or double- stranded CTG repeats. Furthermore, the protein, designated CUG- binding protein (CUGBP) by the authors, exhibited no binding to an RNA oligonucleotide of triplet repeats of the same length but having a different sequence,

CGG. The CUG- binding protein was localized to the cytoplasm, whereas double- stranded DNA binding proteins were localized to the nuclear extract. Thus, Timchenko et al. (1996) concluded that several trinucleotide- binding proteins exist and their specificity is determined by the triplet sequence. CTG trinucleotide repeats encode CUG repeat regions in the corresponding mRNAs. Timchenko et al. (1996) identified 2 proteins, termed CUGBP1 and CUGBP2, that bind specifically to CUG repeats in RNA. They suggested that these 2 proteins, with masses of 49 kD and 51 kD, respectively, are isoforms encoded by the same gene. Timchenko et al. (1996) cloned a gene, termed NAB50 by them, based on the interaction between its protein product and the yeast Nab2 protein. The authors stated that the NAB50 gene encodes the CUGBP1 and CUGBP2 proteins because anti- Nab50 antibodies crossreacted with both CUGBP isoforms. The gene predicts a 482- amino acid protein with a calculated molecular mass of 52 kD. The predicted protein contains 3 RNA-binding domains and is homologous to the hnRNPs

[4887]

[4888] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[4889] Timchenko, L. T.; Miller, J. W.; Timchenko, N. A.; DeVore, D. R.; Datar, K. V.; Lin, L.; Roberts, R.; Caskey, C. T.; Swanson, M. S. : Identification of a (CUG)n triplet repeat RNA- binding protein and its expression in myotonic dystrophy. Nucleic Acids Res. 24: 4407- 4414, 1996. ; and

[4891] Further studies establishing the function and utilities of CUGBP1 are found in John Hopkins OMIM database record ID 601074, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-x-c motif) ligand 3 (CXCL3, Accession NP_002081.1) is another GAM47 target gene, herein designated TARGET GENE. CXCL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL3 BINDING SITE, designated SEQ ID:16187, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[4892] Another function of GAM47 is therefore inhibition of Chemokine (c-x-c motif) ligand 3 (CXCL3, Accession NP_002081.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL3.

[4893] Cytochrome p450, subfamily iic (mephenytoin 4-hydroxylase), polypeptide 9 (CYP2C9, Accession NP_000762.2) is another GAM47 target gene, herein designated TARGET GENE. CYP2C9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP2C9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP2C9 BINDING SITE, designated SEQ ID:10215, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4894] Another function of GAM47 is therefore inhibition of Cytochrome p450, subfamily iic (mephenytoin 4-hydroxylase), polypeptide 9 (CYP2C9, Accession NP_000762.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CYP2C9.

[4895] CYP51A1 (Accession NP_000777.1) is another GAM47 target gene, herein designated TARGET GENE. CYP51A1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CYP51A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP51A1 BINDING SITE, designated SEQ ID:2685, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4896] Another function of GAM47 is therefore inhibition of CYP51A1 (Accession NP_000777.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP51A1.

[4897] Cytochrome p450, subfamily viiib (sterol 12-alpha-hydroxylase), polypeptide 1 (CYP8B1, Accession NP_004382.1) is another GAM47 target gene, herein designated TARGET GENE. CYP8B1 BINDING SITE1 and CYP8B1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CYP8B1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE1 and CYP8B1 BINDING SITE2, designated SEQ ID:704 and SEQ ID:3660 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4898] Another function of GAM47 is therefore inhibition of Cytochrome p450, subfamily viiib (sterol 12-alpha-hydroxylase), polypeptide 1 (CYP8B1, Accession NP_004382.1), a gene which functions in bile acid biosynthesis. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1.

[4899] The function of CYP8B1 has been established by previous studies. Zhang and Chiang (2001) showed that hepatocyte nuclear factor- 4- alpha (HNF4A; 600281) strongly activates CYP8B1 promoter activity, whereas CYP7A promoter- binding factor (CPF, or NR5A2; 604453) has much less effect. The promoter activities were strongly repressed by bile acid. EMSA and site- directed mutagenesis analysis indicated that HNF4A, CPF, and the bile acid response element have overlapping binding sites in CYP8B1. Mammalian 2- hybrid analysis demonstrated interaction of HNF4A with the small heterodimer partner (SHP;

604630). Functional analysis determined that SHP represses HNF4A- induced CYP8B1 transcription. Zhang and Chiang (2001) concluded that bile acids repress human CYP8B1 transcription by reducing the transactivation activity of HNF4A through the interaction of HNF4A with SHP and a reduction of HNF4A expression in liver. Gafvels et al. (1999) obtained cDNAs encoding human and mouse CYP8B1. The deduced 501- amino acid human CYP8B1 protein is approximately 75% identical to the mouse and rabbit proteins. It contains a hydrophobic, membrane-spanning N terminus and conserved oxygen- binding, steroidogenic, and heme- binding segments. Northern blot analysis revealed expression of a 3.9- kb CYP8B1 transcript in liver. In mouse, expression was restricted to liver.

[4900]

[4901] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4902] Gafvels, M.; Olin, M.; Chowdhary, B. P.; Raudsepp, T.; Andersson, U.; Persson, B.; Jansson, M.; Bjorkhem, I.; Eggertsen, G. : Structure and chromosomal assignment of the sterol 12- alpha- hydroxylase gene (CYP8B1) in human

and mouse: eukaryotic cytochrome P- 450 gene devoid of introns. Genomics 56: 184- 196, 1999. ; and

[4903] Zhang, M.; Chiang, J. Y. L. : Transcriptional regulation of the human sterol 12- alpha- hydroxylase gene (CYP8B1): roles of hepatocyte nuclear factor 4- alpha in mediating bile acid repre.

[4904] Further studies establishing the function and utilities of CYP8B1 are found in John Hopkins OMIM database record ID 602172, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dishevelled associated activator of morphogenesis 2 (DAAM2, Accession XP_166434.3) is another GAM47 target gene, herein designated TARGET GENE. DAAM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3097, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4905] Another function of GAM47 is therefore inhibition of Dishevelled associated activator of morphogenesis 2

(DAAM2, Accession XP_166434.3), a gene which controls cell polarity and movement during development. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2.

[4906] The function of DAAM2 has been established by previous studies. By sequencing randomly selected cDNAs corresponding to relatively long transcripts from brain, Nagase et al. (1997) identified a cDNA which they designated KIAA0381. The KIAA0381 cDNA encodes an 864- amino acid protein predicted to be involved in cell division. RT-PCR analysis detected expression of KIAA0381 in most tissues tested. Wnt (see OMIM Ref. No. 164975) signaling via the frizzled receptor (Fz; OMIM Ref. No. 600667) controls cell polarity and movement during development. Habas et al. (2001) reported that in human cells and during Xenopus embryogenesis, Wnt/Fz signaling activates the small GTPase Rho (OMIM Ref. No. 165390), a key regulator of cytoskeleton architecture. Wnt/Fz activation of Rho requires the cytoplasmic protein dishevelled (DVL; OMIM Ref. No. 601365) and a novel formin (see OMIM Ref. No. 136535) homology (FH) protein that they identified and named DAAM1 (OMIM Ref. No. 606626). Habas et al.

(2001) identified DAAM2, which is identical to KIAA0381, as a protein that is closely related to DAAM1.

[4907]

[4908] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4909] Habas, R.; Kato, Y.; He, X. : Wnt/Frizzled activation of Rho regulates vertebrate gastrulation and requires a novel Formin homology protein Daam1. Cell 107: 843- 854, 2001. ; and

[4910] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human gene.

[4911] Further studies establishing the function and utilities of DAAM2 are found in John Hopkins OMIM database record ID 606627, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dynactin 1 (p150, glued homolog, drosophila) (DCTN1, Accession NP_004073.2) is another GAM47 target gene, herein designated TARGET GENE. DCTN1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DCTN1, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCTN1 BINDING SITE, designated SEQ ID:5744, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4912] Another function of GAM47 is therefore inhibition of Dynactin 1 (p150, glued homolog, drosophila) (DCTN1, Accession NP_004073.2), a gene which is a microtubule-based biologic motor protein. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN1.

[4913] The function of DCTN1 has been established by previous studies. Cytoplasmic dynein is a microtubule- based biologic motor protein. Holzbaur and Tokito (1996) noted that dyneins were initially discovered as enzymes that couple ATP hydrolysis to provide a force for cellular motility in eukaryotic cilia and flagella. A distinct cytoplasmic form of dynein (OMIM Ref. No. 600112) was subsequently characterized and thought to be responsible for the intracellular retrograde motility of vesicles and organelles along microtubules (Holzbaur and Vallee, 1994). A large macromolecular complex, dynactin, is required for the cy-

toplasmic dynein- driven movement of organelles along microtubules. Dynactin is composed of 10 distinct polypeptides of 150, 135, 62, 50, 45, 42, 37, 32, 27, and 24 kD, with a combined mass of 10 million daltons. The largest polypeptide of the dynactin complex, p150(Glued), binds directly to microtubules and to cytoplasmic dynein. The binding of dynactin to dynein is critical for neuronal function, as antibodies that specifically disrupt this binding block vesicle motility along microtubules in extruded squid axoplasm. Holzbaur and Tokito (1996) stated that the dynein- dynactin interaction is probably a key component of the mechanism of axonal transport of vesicles and organelles. Further evidence for a critical role for dynactin in vivo comes from the analysis of mutations in the homologous gene in Drosophila. Mutant alleles of the 'glued' gene induced disruption of the neurons of the optic lobe and compound eye in heterozygotes; null mutations are lethal.

[4914]

[4915] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4916] Holzbaur, E. L. F.; Tokito, M. K. : Localization of the

DCTN1 gene encoding p150(Glued) to human chromosome 2p13 by fluorescence in situ hybridization. Genomics 31: 398- 399, 1996. ; and

[4917] Holzbaur, E. L. F.; Vallee, R. B. : Dyneins: molecular structure and cellular function. Ann. Rev. Cell Biol. 10: 339-372, 1994.

[4918] Further studies establishing the function and utilities of DCTN1 are found in John Hopkins OMIM database record ID 601143, and in cited publications listed in Table 5, which are hereby incorporated by reference.DEC1 (Accession NP_059114.1) is another GAM47 target gene, herein designated TARGET GENE. DEC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DEC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DEC1 BINDING SITE, designated SEQ ID:927, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4919] Another function of GAM47 is therefore inhibition of DEC1 (Accession NP_059114.1), a gene which acts as a tumor suppressor associated with esophageal cancer. and there-

fore may be associated with Esophageal cancer. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Esophageal cancer., and of other diseases and clinical conditions associated with DEC1.

[4920] The function of DEC1 has been established by previous studies. Loss of heterozygosity (LOH) is often shown at 9q31 in esophageal squamous cell carcinomas (OMIM Ref. No. 133239) as well as in squamous cell carcinomas of developmentally related tissues such as bladder (OMIM Ref. No. 109800), lung (OMIM Ref. No. 211980), and head and neck. Miura et al. (1996) delineated a region commonly deleted in esophageal squamous cell carcinomas to a 200- kb segment at 9q32. Nishiwaki et al. (2000) sequenced overlapping clones in this commonly deleted region and identified a possible candidate gene, which they named 'deleted in esophageal cancer- 1' (DEC1). The DEC1 gene encodes a deduced 70- amino acid protein. Northern blot analysis detected a 1.4- kb DEC1 transcript in all tissues tested, with highest expression in prostate and testis. DEC1 expression was lower than normal and often absent in more than half of the esophageal carcinomas examined. Furthermore, DEC1 cDNA was able to exert growth suppressive activity in vitro. Although expres-

sion was reduced, no genetic alteration was detected in the DEC1 gene in any of the cancers examined.

[4921]

[4922] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4923] Miura, K.; Suzuki, K.; Tokino, T.; Isomura, M.; Inazawa, J.; Matsuno, S.; Nakamura, Y. : Detailed deletion mapping in squamous cell carcinomas of the esophagus narrows a region containing a putative tumor suppressor gene to about 200 kilobases on distal chromosome 9q. Cancer Res. 56: 1629- 1634, 1996. ; and

[4924] Nishiwaki, T.; Daigo, Y.; Kawasoe, T.; Nakamura, Y. : Isolation and mutational analysis of a novel human cDNA, DEC1 (deleted in esophageal cancer 1), derived from the tumor suppressor l.

[4925] Further studies establishing the function and utilities of DEC1 are found in John Hopkins OMIM database record ID 604767, and in cited publications listed in Table 5, which are hereby incorporated by reference.Defensin, beta 123 (DEFB123, Accession NP_697019.1) is another GAM47 target gene, herein designated TARGET GENE. DEFB123 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by DEFB123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DEFB123 BINDING SITE, designated SEQ ID:13953, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4926] Another function of GAM47 is therefore inhibition of Defensin, beta 123 (DEFB123, Accession NP_697019.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEFB123.

[4927] Digeorge syndrome critical region gene 7 (DGCR7, Accession XP_295022.1) is another GAM47 target gene, herein designated TARGET GENE. DGCR7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DGCR7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DGCR7 BINDING SITE, designated SEQ ID:5400, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4928] Another function of GAM47 is therefore inhibition of Di-

george syndrome critical region gene 7 (DGCR7, Accession XP_295022.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR7.

[4929] DJ473B4 (Accession NP_062456.1) is another GAM47 target gene, herein designated TARGET GENE. DJ473B4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DJ473B4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DJ473B4 BINDING SITE, designated SEQ ID:7830, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4930] Another function of GAM47 is therefore inhibition of DJ473B4 (Accession NP_062456.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ473B4.

[4931] DKFZP434A1315 (Accession NP_115508.2) is another GAM47 target gene, herein designated TARGET GENE. DKFZP434A1315 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434A1315, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434A1315 BINDING SITE, designated SEQ ID:18103, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4932] Another function of GAM47 is therefore inhibition of DKFZP434A1315 (Accession NP_115508.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A1315.

[4933] DKFZP434B172 (Accession XP_046264.6) is another GAM47 target gene, herein designated TARGET GENE. DKFZP434B172 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434B172, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434B172 BINDING SITE, designated SEQ ID:1801, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4934] Another function of GAM47 is therefore inhibition of DK-

FZP434B172 (Accession XP_046264.6) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B172.

[4935] DKFZp434F054 (Accession NP_115635.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZp434F054 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp434F054, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434F054 BINDING SITE, designated SEQ ID:9333, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4936] Another function of GAM47 is therefore inhibition of DKFZp434F054 (Accession NP_115635.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F054.

[4937] DKFZp434F142 (Accession NP_115630.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZp434F142 BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by DKFZp434F142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:16769, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4938] Another function of GAM47 is therefore inhibition of DKFZp434F142 (Accession NP_115630.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F142.

[4939] DKFZP434H132 (Accession NP_056307.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZP434H132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:15842, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated

SEQ ID:269.

[4940] Another function of GAM47 is therefore inhibition of DKFZP434H132 (Accession NP_056307.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132.

[4941] DKFZP434O047 (Accession NP_056409.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZP434O047 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434O047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:7685, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4942] Another function of GAM47 is therefore inhibition of DKFZP434O047 (Accession NP_056409.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047.

[4943] DKFZp451A175 (Accession NP_694967.1) is another

GAM47 target gene, herein designated TARGET GENE. DKFZp451A175 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp451A175, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp451A175 BINDING SITE, designated SEQ ID:9563, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4944] Another function of GAM47 is therefore inhibition of DKFZp451A175 (Accession NP_694967.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp451A175.

[4945] DKFZp547I094 (Accession NP_115531.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZp547I094 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547I094, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, des-

ignated SEQ ID:18222, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4946] Another function of GAM47 is therefore inhibition of DKFZp547I094 (Accession NP_115531.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I094.

[4947] DKFZP564C196 (Accession XP_294974.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZP564C196 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564C196, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564C196 BINDING SITE, designated SEQ ID:16836, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4948] Another function of GAM47 is therefore inhibition of DKFZP564C196 (Accession XP_294974.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DKFZP564C196.

[4949] DKFZP564D172 (Accession NP_114431.2) is another GAM47 target gene, herein designated TARGET GENE. DKFZP564D172 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D172, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564D172 BINDING SITE, designated SEQ ID:8181, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4950] Another function of GAM47 is therefore inhibition of DKFZP564D172 (Accession NP_114431.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D172.

[4951] DKFZP586B1621 (Accession NP_056348.2) is another GAM47 target gene, herein designated TARGET GENE. DKFZP586B1621 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586B1621, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586B1621 BINDING SITE, designated SEQ ID:17013, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4952] Another function of GAM47 is therefore inhibition of DKFZP586B1621 (Accession NP_056348.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586B1621.

[4953] DKFZP586M1523 (Accession NP_056291.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZP586M1523 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586M1523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586M1523 BINDING SITE, designated SEQ ID:7358, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4954] Another function of GAM47 is therefore inhibition of DKFZP586M1523 (Accession NP_056291.1) . Accordingly,

utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1523.

[4955] DKFZP761F241 (Accession NP_113643.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZP761F241 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP761F241, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP761F241 BINDING SITE, designated SEQ ID:4962, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4956] Another function of GAM47 is therefore inhibition of DKFZP761F241 (Accession NP_113643.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761F241.

[4957] DKFZp761G0122 (Accession NP_689874.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZp761G0122 BINDING SITE1 through DKFZp761G0122 BINDING SITE3 are target binding sites found in untrans-

lated regions of mRNA encoded by DKFZp761G0122, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761G0122 BINDING SITE1 through DKFZp761G0122 BINDING SITE3, designated SEQ ID:8022, SEQ ID:6944 and SEQ ID:10800 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4958] Another function of GAM47 is therefore inhibition of DKFZp761G0122 (Accession NP_689874.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0122.

[4959] DKFZP761M1511 (Accession XP_295135.1) is another GAM47 target gene, herein designated TARGET GENE. DKFZP761M1511 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP761M1511, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP761M1511 BINDING SITE, designated SEQ ID:20088, to the nucleotide sequence of

GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4960] Another function of GAM47 is therefore inhibition of DKFZP761M1511 (Accession XP_295135.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761M1511.

[4961] Dickkopf homolog 2 (xenopus laevis) (DKK2, Accession NP_055236.1) is another GAM47 target gene, herein designated TARGET GENE. DKK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKK2 BINDING SITE, designated SEQ ID:17469, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4962] Another function of GAM47 is therefore inhibition of Dickkopf homolog 2 (xenopus laevis) (DKK2, Accession NP_055236.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK2.

[4963] Dmrt-like family b with proline-rich c-terminal, 1

(DMRTB1, Accession NP_149056.1) is another GAM47 target gene, herein designated TARGET GENE. DMRTB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DMRTB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMRTB1 BINDING SITE, designated SEQ ID:18599, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4964] Another function of GAM47 is therefore inhibition of Dmrt-like family b with proline-rich c-terminal, 1 (DMRTB1, Accession NP_149056.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMRTB1.

[4965] Dna (cytosine-5-)-methyltransferase 3 alpha (DNMT3A, Accession NP_783329.1) is another GAM47 target gene, herein designated TARGET GENE. DNMT3A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DNMT3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of DNMT3A BINDING SITE, designated SEQ ID:18807, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4966] Another function of GAM47 is therefore inhibition of Dna (cytosine-5-)-methyltransferase 3 alpha (DNMT3A, Accession NP_783329.1), a gene which intervenes in de novo methylation of DNA. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3A.

[4967] The function of DNMT3A has been established by previous studies. De novo methylation of genomic DNA is a developmentally regulated process that appears to play a pivotal role in regulation of genomic imprinting and X- chromosome inactivation in mammals. Aberrant de novo methylation of growth regulatory genes is associated with tumorigenesis in humans (Baylin et al., 1998). However, Lei et al. (1996) showed that de novo methylation persists in embryonic stem (ES) cells lacking Dnmt1 (OMIM Ref. No. 126375), which encodes the constitutive DNA methyltransferase 1, indicating the existence of independently encoded de novo methyltransferases. By a TBLASTN search of the dbEST database using full- length bacterial type II cytosine- 5 methyltransferase sequences as

queries, followed by isolation and sequencing of overlapping cDNA clones, Okano et al. (1998) identified 2 homologous genes in both human and mouse that contain the highly conserved cytosine- 5 methyltransferase motifs. The mouse genes, termed Dnmt3a and Dnmt3b (OMIM Ref. No. 602900), show little sequence similarity to mouse Dnmt1 and Dnmt2 (OMIM Ref. No. 602478), and masc1 from Ascobolus. The Dnmt3a cDNA is 4,192 bp in length, encoding a protein of 908 amino acids. The human DNMT3A and DNMT3B cDNA are highly homologous to the mouse genes. Dnmt3a and Dnmt3b transcripts are abundantly expressed in undifferentiated embryonic stem cells. Okano et al. (1998) performed other experiments suggesting that Dnmt3a and Dnmt3b encode the long-sought de novo DNA methyltransferases. By FISH, Xie et al. (1999) mapped the DNMT3A gene to 2p23. Robertson et al. (1999) also mapped the DNMT3A gene to 2p23 using FISH

[4968] Animal model experiments lend further support to the function of DNMT3A. Okano et al. (1999) generated mice with targeted disruption of the Dnmt3a and Dnmt3b genes. Inactivation of both genes blocked de novo methylation in embryonic stem cells and early embryos but had

no effect on maintenance of imprinted methylation patterns. Dnmt3a - /- mice developed to term and appeared to be normal at birth. However, most homozygous mutant mice became runted and died at about 4 weeks of age. In contrast, no viable Dnmt3b - /- mice were recovered at birth. Dissection of embryos at different stages of development revealed that Dnmt3b - /- embryos had multiple developmental defects, including growth impairment and rostral neural tube defects with variable severity at later stages of development, though most of them appeared to develop normally before E9.5. Dnmt3a and Dnmt3b also exhibited nonoverlapping functions in development, with Dnmt3b specifically required for methylation of centromeric minor satellite repeats. These results indicated that both Dnmt3a and Dnmt3b are required for genomewide de novo methylation and are essential for mammalian development.

[4969] It is appreciated that the abovementioned animal model for DNMT3A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[4970] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[4971] Okano, M.; Xie, S.; Li, E. : Cloning and characterization of a family of novel mammalian DNA (cytosine- 5) methyl-transferases. (Letter) Nature Genet. 19: 219- 220, 1998. ; and

[4972] Robertson, K. D.; Uzvolgyi, E.; Liang, G.; Talmadge, C.; Sumegi, J.; Gonzales, F. A.; Jones, P. A. : The human DNA methyltransferases (DNMTs) 1, 3a and 3b: coordinate mRNA expression in.

[4973] Further studies establishing the function and utilities of DNMT3A are found in John Hopkins OMIM database record ID 602769, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Dihydropyrimidinase-like 2 (DPYSL2, Accession NP_001377.1) is another GAM47 target gene, herein des-ignated TARGET GENE. DPYSL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DPYSL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, desig-nated SEQ ID:9773, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ

ID:269.

[4974] Another function of GAM47 is therefore inhibition of Dihydropyrimidinase-like 2 (DPYSL2, Accession NP_001377.1), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2.

[4975] The function of DPYSL2 has been established by previous studies. Hamajima et al. (1996) isolated a human cDNA encoding dihydropyrimidinase- like 2 (OMIM Ref. No. DPYSL2), called DRP2 by them, from a fetal brain cDNA library (see OMIM Ref. No. 222748). The DPYSL2 protein has 572 amino acids. Northern blot analysis detected a 4.9- kb DPYSL2 transcript in all tissues examined except liver. Hamajima et al. (1996) noted that 3 ESTs mapped to 8p21 by Koyama et al. (1995) correspond to a portion of the coding region of DPYSL2.

[4976]

[4977] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4978] Hamajima, N.; Matsuda, K.; Sakata, S.; Tamaki, N.; Sasaki, M.; Nonaka, M. : A novel gene family defined by human

dihydropyrimidinase and three related proteins with differential tissue distribution. Gene 180: 157- 163, 1996. ; and

[4979] Koyama, K.; Sudo, K.; Nakamura, Y. : Isolation of 115 human chromosome 8- specific expressed- sequence tags by exon amplification. Genomics 26: 245- 253, 1995.

[4980] Further studies establishing the function and utilities of DPYSL2 are found in John Hopkins OMIM database record ID 602463, and in cited publications listed in Table 5, which are hereby incorporated by reference.Developmentally regulated gtp binding protein 2 (DRG2, Accession NP_001379.1) is another GAM47 target gene, herein designated TARGET GENE. DRG2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DRG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRG2 BINDING SITE, designated SEQ ID:8205, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4981] Another function of GAM47 is therefore inhibition of Developmentally regulated gtp binding protein 2 (DRG2, Ac-

cession NP_001379.1), a gene which may play a role in cell proliferation, differentiation and death. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRG2.

[4982] The function of DRG2 has been established by previous studies. Using a subtractive hybridization strategy, Schenker et al. (1994) identified embryonic lung fibroblast cDNAs whose expression was selectively repressed in SV40- transformed cells. One cDNA encoded a predicted 364- amino acid protein that was designated DRG2. DRG2 contains the 5 sequence motifs that are conserved in all GTP- binding proteins. Northern blot analysis detected DRG2 expression as a major 2- kb and a minor 1.5- kb transcript in various tissues. The shorter mRNA appeared to result from use of an alternative polyadenylation site. By fluorescence in situ hybridization, Schenker and Trueb (1997) mapped the DRG2 gene to 17p13- p12. Vlangos et al. (2000) mapped the DRG2 gene to 17p11.2 within the Smith- Magenis syndrome critical region by somatic cell hybrid analysis.

[4983]

[4984] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[4985] Schenker, T.; Lach, C.; Kessler, B.; Calderara, S.; Trueb, B. : A novel GTP- binding protein which is selectively repressed in SV40 transformed fibroblasts. J. Biol. Chem. 269: 25447- 25453, 1994. ; and

[4986] Vlangos, C. N.; Das, P.; Patel, P. I.; Elsea, S. H. : Assignment of developmentally regulated GTP- binding protein (DRG2) to human chromosome band 17p11.2 with somatic cell hybrids and l.

[4987] Further studies establishing the function and utilities of DRG2 are found in John Hopkins OMIM database record ID 602986, and in cited publications listed in Table 5, which are hereby incorporated by reference.Deltex homolog 2 (drosophila) (DTX2, Accession NP_065943.1) is another GAM47 target gene, herein designated TARGET GENE. DTX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DTX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DTX2 BINDING SITE, designated SEQ ID:15714, to the nucleotide sequence of GAM47 RNA, herein designated GAM

RNA, also designated SEQ ID:269.

[4988] Another function of GAM47 is therefore inhibition of Deltex homolog 2 (drosophila) (DTX2, Accession NP_065943.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTX2.

[4989] Deoxythymidylate kinase (thymidylate kinase) (DTYMK, Accession NP_036277.1) is another GAM47 target gene, herein designated TARGET GENE. DTYMK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DTYMK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DTYMK BINDING SITE, designated SEQ ID:3722, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4990] Another function of GAM47 is therefore inhibition of Deoxythymidylate kinase (thymidylate kinase) (DTYMK, Accession NP_036277.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTYMK.

[4991] DULLARD (Accession NP_056158.2) is another GAM47 tar-

get gene, herein designated TARGET GENE. DULLARD BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DULLARD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DULLARD BINDING SITE, designated SEQ ID:11968, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4992] Another function of GAM47 is therefore inhibition of DULLARD (Accession NP_056158.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DULLARD.

[4993] Dishevelled, dsh homolog 3 (drosophila) (DVL3, Accession NP_004414.2) is another GAM47 target gene, herein designated TARGET GENE. DVL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DVL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:18567, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[4994] Another function of GAM47 is therefore inhibition of Dishevelled, dsh homolog 3 (drosophila) (DVL3, Accession NP_004414.2), a gene which regulates cell proliferation. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3.

[4995] The function of DVL3 has been established by previous studies. The Drosophila dishevelled gene (dsh) encodes a cytoplasmic phosphoprotein (Klingensmith et al., 1994) that regulates cell proliferation, acting as a transducer molecule for developmental processes, including segmentation and neuroblast specification. Pizzuti et al. (1996) noted that dsh is required for the function of the wingless gene product wg, a segment polarity gene homologous to the mammalian protooncogene WNT1 (OMIM Ref. No. 164820). Pizzuti et al. (1996) reported the isolation and chromosomal mapping of 2 human dsh homologs, designated DVL1 (OMIM Ref. No. 601365) and DVL3 by them. The human dsh homologs were isolated from a fetal brain cDNA library. DVL3 encodes a predicted 716- amino acid polypeptide that shows 74% nucleotide homology with human DVL1 and 71% homology with the mouse Dvl1 gene. DVL1 and DVL3 share 64% amino acid identity. Piz-

zuti et al. (1996) reported that homology is particularly high in the N- terminal region and that there is more divergence in the C- terminal regions. PCR carried out using DNA from rodent human somatic cell hybrids and DVL3 specific primers led to the assignment of DVL3 to human chromosome 3. Pizzuti et al. (1996) regionally assigned DVL3 to band 3q27 using fluorescence in situ hybridization. Hybridization of poly(A) mRNA with the DVL3 cDNA revealed a 2.9- kb transcript with abundant expression in skeletal muscle, pancreas and heart. They also detected 5.9- kb and 5.0- kb transcripts in skeletal muscle, adult liver, adult heart, pancreas, and placenta. The 5.9- kb form was abundant in fetal tissues but the 5.0- kb form was absent from these tissues. Pizzuti et al. (1996) noted that Charcot- Marie- Tooth type 2B (OMIM Ref. No. 600882) maps to chromosome 3q. Bui et al. (1997) also isolated human DVL3, which shares 98% amino acid identity with mouse Dvl3 and 49% with Drosophila dsh. The authors confirmed the chromosomal localization at 3p27. Semenov and Snyder (1997) isolated 3 human genes encoding proteins homologous to Drosophila dsh. The cDNA sequence of DVL3 reported by Semenov and Snyder (1997) differs from the previously reported sequences de-

posited in GenBank. Bui et al. (1997) detected expression of DVL3 mRNA in B cells, breast, kidney, bladder, endometrium, and 2 primary endometrial cultures. It was detected equally in normal human breast tissues and tumors and in colorectal samples of normal tissues, polyps, and tumors.

[4996]

[4997] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[4998] Pizzuti, A.; Amati, F.; Calabrese, G.; Mari, A.; Colosimo, A; Silani, V.; Giardino, L.; Ratti, A.; Penso, D.; Calza, L.; Palka, G.; Scarlato, G.; Novelli, G.; Dallapicolla, B. : cDNA characterization and chromosomal mapping of two human homologs of the Drosophila dishevelled polarity gene. Hum. Molec. Genet. 5: 953- 958, 1996. ; and

[4999] Semenov, M. V.; Snyder, M. : Human dishevelled genes constitute a DHR- containing multigene family. Genomics 42: 302- 310, 1997.

[5000] Further studies establishing the function and utilities of DVL3 are found in John Hopkins OMIM database record ID 601368, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ephrin-b2 (EFNB2,

Accession NP_004084.1) is another GAM47 target gene, herein designated TARGET GENE. EFNB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EFNB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EFNB2 BINDING SITE, designated SEQ ID:8500, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5001] Another function of GAM47 is therefore inhibition of Ephrin-b2 (EFNB2, Accession NP_004084.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB2.

[5002] Ets homologous factor (EHF, Accession NP_758433.1) is another GAM47 target gene, herein designated TARGET GENE. EHF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EHF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EHF BINDING SITE, designated

SEQ ID:7855, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5003] Another function of GAM47 is therefore inhibition of Ets homologous factor (EHF, Accession NP_758433.1), a gene which is Member of the ESE subfamily of Ets transcription factors. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHF.

[5004] The function of EHF has been established by previous studies. By searching an EST database, Kas et al. (2000) identified an EST with sequence similarity to the ETS domain of human ESE1 (ELF3; 602191). They obtained a full-length cDNA encoding EHF, which they called ESE3, by using 5- prime RACE on human prostate cDNA. RT- PCR analysis identified 2 alternatively spliced forms of ESE3, ESE3a and ESE3b. Sequence analysis predicted that ESE3a encodes a 277- amino acid protein with a molecular mass of 32.3 kD, while ESE3b encodes a 300- amino acid protein with a molecular mass of 34.9 kD. The C- terminal ETS domain of ESE3 is 84% and 65% identical to the ETS domains of ESE1 and ESE2 (ELF5; 605169), respectively. Northern blot analysis detected a 5.9- kb ESE3 transcript in pancreas and prostate, with lower levels detected in

kidney and colon. Dot blot analysis detected high levels of ESE3 expression in salivary gland, prostate, and trachea, with lower levels detected in colon, mammary gland, pancreas, lung, stomach, appendix, fetal kidney, and fetal lung. Using RT- PCR on primary and tumor- derived cell lines, the authors detected expression of ESE3 in tumor cells of epithelial origin. Gel- shift experiments showed binding of ESE3 to 3 high- affinity binding sites in the MET (OMIM Ref. No. 164860) promoter. Cotransfection of ESE3 expression vectors with a MET promoter- luciferase reporter construct demonstrated that both ESE3a and ESE3b act as transcriptional activators on this promoter. Kleinbaum et al. (1999) mapped the EHF gene to 11p12 by somatic cell hybrid analysis and FISH.

[5005]

[5006] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5007] Kas, K.; Finger, E.; Grall, F.; Gu, X.; Akbarali, Y.; Boltax, J.; Weiss, A.; Oettgen, P.; Kapeller, R.; Libermann, T. A. : ESE-3, a novel member of an epithelium- specific Ets transcription factor subfamily, demonstrates different target gene specificity from ESE- 1. J. Biol. Chem. 275: 2986-

2998, 2000. ; and

[5008] Kleinbaum, L. A.; Duggan, C.; Ferreira, E.; Coffey, G. P.; Buttice, G.; Burton, F. H. : Human chromosomal localization, tissue/tumor expression, and regulatory function of the ets fami.

[5009] Further studies establishing the function and utilities of EHF are found in John Hopkins OMIM database record ID 605439, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ets homologous factor (EHF, Accession NP_036285.2) is another GAM47 target gene, herein designated TARGET GENE. EHF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EHF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EHF BINDING SITE, designated SEQ ID:7855, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5010] Another function of GAM47 is therefore inhibition of Ets homologous factor (EHF, Accession NP_036285.2), a gene which is Member of the ESE subfamily of Ets transcription factors. Accordingly, utilities of GAM47 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with EHF.

[5011] The function of EHF has been established by previous studies. By searching an EST database, Kas et al. (2000) identified an EST with sequence similarity to the ETS domain of human ESE1 (ELF3; 602191). They obtained a full-length cDNA encoding EHF, which they called ESE3, by using 5- prime RACE on human prostate cDNA. RT- PCR analysis identified 2 alternatively spliced forms of ESE3, ESE3a and ESE3b. Sequence analysis predicted that ESE3a encodes a 277- amino acid protein with a molecular mass of 32.3 kD, while ESE3b encodes a 300- amino acid protein with a molecular mass of 34.9 kD. The C- terminal ETS domain of ESE3 is 84% and 65% identical to the ETS domains of ESE1 and ESE2 (ELF5; 605169), respectively. Northern blot analysis detected a 5.9- kb ESE3 transcript in pancreas and prostate, with lower levels detected in kidney and colon. Dot blot analysis detected high levels of ESE3 expression in salivary gland, prostate, and trachea, with lower levels detected in colon, mammary gland, pancreas, lung, stomach, appendix, fetal kidney, and fetal lung. Using RT- PCR on primary and tumor- derived cell lines, the authors detected expression of ESE3 in tumor

cells of epithelial origin. Gel- shift experiments showed binding of ESE3 to 3 high- affinity binding sites in the MET (OMIM Ref. No. 164860) promoter. Cotransfection of ESE3 expression vectors with a MET promoter- luciferase reporter construct demonstrated that both ESE3a and ESE3b act as transcriptional activators on this promoter. Kleinbaum et al. (1999) mapped the EHF gene to 11p12 by somatic cell hybrid analysis and FISH.

[5012]

[5013] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5014] Kas, K.; Finger, E.; Grall, F.; Gu, X.; Akbarali, Y.; Boltax, J.; Weiss, A.; Oettgen, P.; Kapeller, R.; Libermann, T. A. : ESE-3, a novel member of an epithelium- specific Ets transcription factor subfamily, demonstrates different target gene specificity from ESE- 1. J. Biol. Chem. 275: 2986-2998, 2000. ; and

[5015] Kleinbaum, L. A.; Duggan, C.; Ferreira, E.; Coffey, G. P.; Buttice, G.; Burton, F. H. : Human chromosomal localization, tissue/tumor expression, and regulatory function of the ets fami.

[5016] Further studies establishing the function and utilities of

EHF are found in John Hopkins OMIM database record ID 605439, and in cited publications listed in Table 5, which are hereby incorporated by reference.Enoyl-coenzyme a, hydratase/3-hydroxyacyl coenzyme a dehydrogenase (EHHADH, Accession NP_001957.1) is another GAM47 target gene, herein designated TARGET GENE. EHHADH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EHHADH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EHHADH BINDING SITE, designated SEQ ID:11906, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5017] Another function of GAM47 is therefore inhibition of Enoyl-coenzyme a, hydratase/3-hydroxyacyl coenzyme a dehydrogenase (EHHADH, Accession NP_001957.1), a gene which functions in the peroxisomal beta- oxidation pathway and therefore may be associated with Peroxisomal disorders. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Peroxisomal disorders, and of other diseases and clinical conditions associated with EHHADH.

[5018] The function of EHHADH has been established by previous studies. Hoefler et al. (1994) reported the full- length cDNA sequence of the enoyl- CoA- hydratase:3- hydroxy- acyl- CoA dehydrogenase bifunctional enzyme. The cDNA sequence spans 3,779 nucleotides with an open reading frame of 2,169 nucleotides.

[5019] Animal model experiments lend further support to the function of EHHADH. Qi et al. (1999) generated Lpb null mice. Mutant mice were viable and fertile and exhibited no detectable gross phenotypic defects. The only defect was a blunting of peroxisome proliferative response upon challenge with a peroxisome proliferator. The absence of appreciable changes in lipid metabolism indicated that enoyl- CoAs, generated in the classical system in Lpb null mice, were diverted to the D- hydroxy- specific system for metabolism by Dpb (OMIM Ref. No. 601860).

[5020] It is appreciated that the abovementioned animal model for EHHADH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further ap- preciated from the publications sited hereinbelow.

[5021] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5022] Hoefler, G.; Forstner, M.; McGuinness, M. C.; Hulla, W.; Hiden, M.; Krisper, P.; Kenner, L.; Ried, T.; Lengauer, C.; Zechner, R.; mOser, H. W.; Chen, G. L. : cDNA cloning of the human peroxisomal enoyl- CoA hydratase:3- hydroxyacyl- CoA dehydrogenase bifunctional enzyme and localization to chromosome 3q26.3- 3q28: a free left Alu arm is inserted in the 3- prime noncoding region. Genomics 19: 60- 67, 1994. ; and

[5023] Qi, C.; Zhu, Y.; Pan, J.; Usuda, N.; Maeda, N.; Yeldandi, A. V.; Rao, M. S.; Hashimoto, T.; Reddy, J. K. : Absence of spontaneous peroxisome proliferation in enoyl- CoA hydratase/L- 3- hyd.

[5024] Further studies establishing the function and utilities of EHHADH are found in John Hopkins OMIM database record ID 607037, and in cited publications listed in Table 5, which are hereby incorporated by reference.EI24 (Accession NP_004870.2) is another GAM47 target gene, herein designated TARGET GENE. EI24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EI24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EI24 BINDING SITE, desig-

nated SEQ ID:3180, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5025] Another function of GAM47 is therefore inhibition of EI24 (Accession NP_004870.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EI24.

[5026] Elongation of very long chain fatty acids (fen1/elo2, sur4/elo3, yeast)-like 2 (ELOVL2, Accession NP_060240.1) is another GAM47 target gene, herein designated TARGET GENE. ELOVL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ELOVL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ELOVL2 BINDING SITE, designated SEQ ID:11804, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5027] Another function of GAM47 is therefore inhibition of Elongation of very long chain fatty acids (fen1/elo2, sur4/elo3, yeast)-like 2 (ELOVL2, Accession NP_060240.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ELOVL2.

[5028] EMR3 (Accession NP_693634.1) is another GAM47 target gene, herein designated TARGET GENE. EMR3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EMR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR3 BINDING SITE, designated SEQ ID:3525, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5029] Another function of GAM47 is therefore inhibition of EMR3 (Accession NP_693634.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR3.

[5030] ENDOGLYX1 (Accession NP_079032.1) is another GAM47 target gene, herein designated TARGET GENE. ENDOGLYX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ENDOGLYX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENDOGLYX1 BINDING SITE, designated SEQ ID:11245,

to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5031] Another function of GAM47 is therefore inhibition of ENDOGLYX1 (Accession NP_079032.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOGLYX1.

[5032] Enolase 1, (alpha) (ENO1, Accession NP_001419.1) is another GAM47 target gene, herein designated TARGET GENE. ENO1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ENO1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENO1 BINDING SITE, designated SEQ ID:19121, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5033] Another function of GAM47 is therefore inhibition of Enolase 1, (alpha) (ENO1, Accession NP_001419.1), a gene which is a glycolytic enzyme. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENO1.

[5034] The function of ENO1 has been established by previous

studies. Enolase is a glycolytic enzyme (2- phospho- D-glycerate hydrolyase; EC 4.2.1.11). Each of the 3 ENO isoenzymes is a homodimer composed of 2 alpha (ENO1), 2 gamma (ENO2; 131360), or 2 beta (ENO3; 131370) subunits. Isoenzyme alpha (ENO1) is present in most tissues, whereas the beta form (ENO3) is localized to muscle and the gamma form (ENO2) is found only in nervous tissue. Giallongo et al. (1986) cloned and sequenced a full-length cDNA for human alpha- enolase. Its coding region was found to be 1,299 bases long. The 433- amino acid protein shows 67% homology to yeast enolase and 94% homology to rat nonneural enolase. Wistow et al. (1988) presented evidence for the remarkable conclusion that alpha- enolase is encoded by the same gene that encodes tau- crystallin, a lens structural protein. Giblett et al. (1974) observed an electrophoretic variant of red cell PPH among Cree Indians. Linkage was found with the Rhesus locus. Since the Rh locus has been assigned to chromosome 1 and since cell hybridization studies assign the PPH locus to chromosome 1, the new data are consistent. The Goss- Harris method of mapping combines features of recombinational study in families and synteny tests in hybrid cells. As applied to chromosome 1, the method

shows that AK2 and UMPK are distal to PGM1 and that the order of the loci is PGM1: UMPK: (AK2, alpha- FUC): ENO1 (Goss and Harris, 1977). Comings (1972) and Ohno (1973) suggested that during vertebrate evolution tetraploidization occurred 2- 3 hundred million years ago and that chromosomal events that tend to preserve ancestral linkage groups, such as Robertsonian fusions, inversions and gene duplications, have been favored. Demonstration of linkage of homologous genes supports this hypothesis. D'Ancona et al. (1977) regionalized ENO1 to 1pter-p36.13. Lalley et al. (1978) demonstrated synteny of enolase, PGD (OMIM Ref. No. 172200), PGM1 (OMIM Ref. No. 171900), and AK2 (OMIM Ref. No. 103020) on chromosome 4 of the mouse; they are on 1p of man. Feo et al. (1990) concluded that there is a single alpha- enolase pseudogene in the human genome. This intronless, processed pseudogene was mapped to chromosome 1 by Southern blot analysis of rodent- human hybrid cell DNAs; thus, it is on the same chromosome as the functional gene. Ribaudo et al. (1996) confirmed the assignment of ENO1P to chromosome 1. By fluorescence in situ hybridization, they found that it is located on 1q41- q42, whereas the functional gene is located on the short arm of

that chromosome. Lachant et al. (1986) and Lachant and Tanaka (1987) reported 4 generations of a Caucasian family with hereditary red cell enolase deficiency. Partial deficiency in this kindred behaved as an autosomal dominant and was associated with a spherocytic phenotype, although a normal acidified glycerol lysis test suggested that the spherocytes of enolase deficiency are different from those of hereditary spherocytosis (OMIM Ref. No. 182900). Clinical expression of enolase deficiency varied in this family. Some had slightly low hematocrit with elevated reticulocytes, while others had no evidence of anemia or hemolysis.

[5035]

Sequence 1: 79- .

[5039] Further studies establishing the function and utilities of ENO1 are found in John Hopkins OMIM database record ID 172430, and in cited publications listed in Table 5, which are hereby incorporated by reference.Erythrocyte membrane protein band 4.9 (dematin) (EPB49, Accession NP_001969.1) is another GAM47 target gene, herein designated TARGET GENE. EPB49 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EPB49, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPB49 BINDING SITE, designated SEQ ID:9779, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5040] Another function of GAM47 is therefore inhibition of Erythrocyte membrane protein band 4.9 (dematin) (EPB49, Accession NP_001969.1), a gene which is an actin-bundling protein. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB49.

[5041] The function of EPB49 has been established by previous studies. Chishti et al. (1989) proposed the name dematin

(from the Greek 'dema,' a bundle) for an actin- bundling protein originally identified in the human erythroid membrane skeleton. It consists of 2 polypeptide chains of 48 and 52 kD that have been identified as protein 4.9 on SDS/polyacrylamide gels. In solution, dematin exists as a trimer and bundles actin filaments in a phosphorylation-dependent manner. Its actin- bundling activity is abolished upon phosphorylation by cAMP- dependent protein kinase and is restored after dephosphorylation. See review of Gilligan and Bennett (1993). Rana et al. (1993) reported the complete primary structure of human erythroid dematin, whose sequence includes a homolog of the 'headpiece' sequence found at the C- terminus of villin (OMIM Ref. No. 193040). The headpiece is essential for villin function in inducing microvillar development and actin redistribution. The widespread expression of dematin transcripts in human tissue suggests that dematin and its homologs may substitute for villin in villin- negative tissues to regulate actin reorganization by a phosphorylation-regulated mechanism. Peters et al. (1995) demonstrated that the murine dematin gene, symbolized Epb4.9, maps to chromosome 14. They raised the possibility that dematin mutations may be involved in neurologic abnormal-

ities in the mouse. Although dematin is an actin- bundling protein of the erythroid membrane skeleton, it is abundantly expressed in human brain, heart, skeletal muscle, kidney, and lung. Azim et al. (1995) noted that the 48- kD subunit of dematin contains the headpiece domain of villin which is essential for its morphogenic function in vivo. Azim et al. (1995) reported the primary structure of the 52- kD subunit of dematin which differs from the 48- kD subunit by a 22- amino acid insertion within its headpiece domain. A unique feature of the insertion sequence of the 52- kD subunit is its homology to erythrocyte protein 4.2 (OMIM Ref. No. 177070). Using somatic cell hybrid panels and fluorescence in situ hybridization, Azim et al. (1995) localized the dematin gene to 8p21.1, a site distal to the locus of ankyrin (OMIM Ref. No. 182900) at 8p11.2. Azim et al. (1996) demonstrated that dematin and protein 4.2 (OMIM Ref. No. 177070) bind ATP. Although the functional significance is not clear, the findings open new perspectives for the function of these 2 proteins in vivo. By using homologous recombination in mouse embryonic stem cells, Khanna et al. (2002) deleted the headpiece domain of dematin to evaluate its function in vivo. Dematin headpiece- null mice were viable and born at the

expected mendelian ratio. Hematologic evaluation showed evidence of compensated anemia and spherocytosis in these mice, however. The headpiece- null erythrocytes were osmotically fragile, and displayed reduced deformability and filterability. In vitro, significantly greater membrane fragmentation of these erythrocytes was demonstrated. Biochemical characterization showed a weakened membrane skeleton evidenced by reduced association of spectrin and actin to the plasma membrane. Together, these results provided evidence for the physiologic significance of dermatin and demonstrated a role for the headpiece domain in the maintenance of structural integrity and mechanical properties of red cells in vivo.

gene encoding the erythrocyte membrane skeleton protein dematin (Epb4.9) maps to mouse chromosome 14. Genomics 26: 634- 63.

[5046] Further studies establishing the function and utilities of EPB49 are found in John Hopkins OMIM database record ID 125305, and in cited publications listed in Table 5, which are hereby incorporated by reference.F11R (Accession NP_653084.1) is another GAM47 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:7420, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5047] Another function of GAM47 is therefore inhibition of F11R (Accession NP_653084.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[5048] F11R (Accession NP_058642.1) is another GAM47 target gene, herein designated TARGET GENE. F11R BINDING SITE

is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:7420, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5049] Another function of GAM47 is therefore inhibition of F11R (Accession NP_058642.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[5050] F11R (Accession NP_653085.1) is another GAM47 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:7420, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5051] Another function of GAM47 is therefore inhibition of F11R

(Accession NP_653085.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[5052] F11R (Accession NP_653086.1) is another GAM47 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:7420, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5053] Another function of GAM47 is therefore inhibition of F11R (Accession NP_653086.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[5054] F11R (Accession NP_653087.1) is another GAM47 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:7420, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5055] Another function of GAM47 is therefore inhibition of F11R (Accession NP_653087.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[5056] Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_075266.1) is another GAM47 target gene, herein designated TARGET GENE. FACL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FACL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:7050, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5057] Another function of GAM47 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_075266.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with FACL4.

[5058] Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_004449.1) is another GAM47 target gene, herein designated TARGET GENE. FACL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FACL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:7050, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5059] Another function of GAM47 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_004449.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4.

[5060] Fatty-acid-coenzyme a ligase, long-chain 5 (FACL5, Accession NP_057318.1) is another GAM47 target gene, herein designated TARGET GENE. FACL5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FACL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL5 BINDING SITE, designated SEQ ID:17702, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5061] Another function of GAM47 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 5 (FACL5, Accession NP_057318.1), a gene which may be involved in fatty acid metabolism; contains an AMP- binding domain and therefore may be associated with Malignant gliomas. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Malignant gliomas, and of other diseases and clinical conditions associated with FACL5.

[5062] The function of FACL5 has been established by previous studies. Acyl- CoA synthetase (ACS; EC 6.2.1.3) catalyzes the formation of acyl- CoA from fatty acid, ATP, and CoA. This reaction is essential in mammalian fatty acid metabolism. In addition, ACS mediates the transportation of fatty acids into cells by cooperating with the fatty acid transporter protein (FATP; 600691). Oikawa et al. (1998) cloned rat Acs5 and found that it is highly expressed in proliferating 3T3- L1 cells. By screening a liver cDNA library with rat ACS5 as the probe, Yamashita et al. (2000)

isolated a cDNA encoding human ACS5. The deduced 683- amino acid protein shares approximately 80% amino acid identity with the rat sequence. Northern blot analysis detected 2 major ACS5 transcripts of 2.5 and 3.7 kb in a wide range of tissues, with highest expression in uterus and spleen. Markedly increased levels of ACS5 transcripts were detected in a glioma line and in primary gliomas of grade IV malignancy, while ACS5 expression was found to be low in normal brain. Yamashita et al. (2000) found that cultured glioma cells infected with an adenovirus encoding ACS5 displayed induced cell growth on exposure to palmitate. Consistent with the induction of cell growth, the virus- infected cells displayed induced uptake of palmitate. These results demonstrated a novel fatty acid-induced glioma cell growth mediated by ACS5.

[5063]

[5064] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5065] Oikawa, E.; Iijima, H.; Suzuki, T.; Sasano, H.; Sato, H.; Kamataki, A.; Nagura, H.; Kang, M. J.; Fujino, T.; Suzuki, H.; Yamamoto, T. T. : A novel acyl- CoA synthetase, ACS5, expressed in intestinal epithelial cells and proliferating

preadipocytes. J. Biochem. 124: 679- 685, 1998. ; and

[5066] Yamashita, Y.; Kumabe, T.; Cho, Y.- Y.; Watanabe, M.; Kawagishi, J.; Yoshimoto, T.; Fujino, T.; Kang, M.- J.; Yamamoto, T. T. : :Fatty acid induced glioma cell growth is mediated by the a.

[5067] Further studies establishing the function and utilities of FACL5 are found in John Hopkins OMIM database record ID 605677, and in cited publications listed in Table 5, which are hereby incorporated by reference.F-box and leucine-rich repeat protein 2 (FBXL2, Accession NP_036289.2) is another GAM47 target gene, herein designated TARGET GENE. FBXL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FBXL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXL2 BINDING SITE, designated SEQ ID:11065, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5068] Another function of GAM47 is therefore inhibition of F-box and leucine-rich repeat protein 2 (FBXL2, Accession NP_036289.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with FBXL2.

[5069] Fibroblast growth factor 23 (FGF23, Accession NP_065689.1) is another GAM47 target gene, herein designated TARGET GENE. FGF23 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FGF23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF23 BINDING SITE, designated SEQ ID:15431, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5070] Another function of GAM47 is therefore inhibition of Fibroblast growth factor 23 (FGF23, Accession NP_065689.1), a gene which a member of the fibroblast growth factor family . and therefore is associated with Autosomal dominant hypophosphatemic rickets . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Autosomal dominant hypophosphatemic rickets ., and of other diseases and clinical conditions associated with FGF23.

[5071] The function of FGF23 has been established by previous studies. The FGF23 gene encodes a member of the fibroblast growth factor family that is mutant in autosomal

dominant hypophosphatemic rickets (OMIM Ref. No. 193100). Using the mouse Fgf23 sequence as query, Yamashita et al. (2000) identified FGF23 in a genomic database. They cloned the full- length cDNA from a placenta library. The deduced 251- amino acid protein contains an N- terminal 24- amino acid signal sequence. FGF23 shares 72% sequence identity with mouse Fgf23, and 24% and 22% identity with human FGF21 and FGF19, respectively. By quantitative PCR, Yamashita et al. (2000) found highest expression of Fgf23 in mouse brain and lower expression in thymus. In situ hybridization of mouse brain revealed discrete specific labeling only in the ventrolateral thalamic nucleus. Autosomal dominant hypophosphatemic rickets (ADHR; 193100) is characterized by low serum phosphorus concentrations, rickets, osteomalacia, leg deformities, short stature, bone pain, and dental abscesses. The ADHR Consortium (2000) described a positional cloning approach used to identify the gene mutated in ADHR. They identified mutations in the FGF23 gene in affected members of families segregating ADHR. The ADHR Consortium (2000) found that the FGF23 gene lies 54 kb telomeric of FGF6 (OMIM Ref. No. 134921) on 12p13.

[5072]

[5073] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5074] Yamashita, T.; Yoshioka, M.; Itoh, N. : Identification of a novel fibroblast growth factor, FGF- 23, preferentially expressed in the ventrolateral thalamic nucleus of the brain. Biochem. Biophys. Res. Commun. 277: 494- 498, 2000. ; and

[5075] ADHR Consortium : Autosomal dominant hypophosphataemic rickets is associated with mutations in FGF23. Nature Genet. 26: 345- 348, 2000.

[5076] Further studies establishing the function and utilities of FGF23 are found in John Hopkins OMIM database record ID 605380, and in cited publications listed in Table 5, which are hereby incorporated by reference.FKSG44 (Accession NP_114110.1) is another GAM47 target gene, herein designated TARGET GENE. FKSG44 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FKSG44, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKSG44 BINDING

SITE, designated SEQ ID:14084, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5077] Another function of GAM47 is therefore inhibition of FKSG44 (Accession NP_114110.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG44.

[5078] FLJ11259 (Accession NP_060840.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ11259 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:1282, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5079] Another function of GAM47 is therefore inhibition of FLJ11259 (Accession NP_060840.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259.

[5080] FLJ11280 (Accession NP_060849.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ11280

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11280, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11280 BINDING SITE, designated SEQ ID:5027, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5081] Another function of GAM47 is therefore inhibition of FLJ11280 (Accession NP_060849.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11280.

[5082] FLJ11539 (Accession NP_079024.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ11539 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11539, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11539 BINDING SITE, designated SEQ ID:16128, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5083] Another function of GAM47 is therefore inhibition of

FLJ11539 (Accession NP_079024.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11539.

[5084] FLJ11565 (Accession NP_078933.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ11565 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11565, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11565 BINDING SITE, designated SEQ ID:4833, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5085] Another function of GAM47 is therefore inhibition of FLJ11565 (Accession NP_078933.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11565.

[5086] FLJ11608 (Accession NP_078833.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ11608 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11608, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ11608 BINDING SITE, designated SEQ ID:4010, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5087] Another function of GAM47 is therefore inhibition of FLJ11608 (Accession NP_078833.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11608.

[5088] FLJ12221 (Accession XP_031342.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ12221 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12221, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12221 BINDING SITE, designated SEQ ID:15788, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5089] Another function of GAM47 is therefore inhibition of FLJ12221 (Accession XP_031342.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12221.

[5090] FLJ12270 (Accession XP_290704.1) is another GAM47 tar-

get gene, herein designated TARGET GENE. FLJ12270 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12270, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12270 BINDING SITE, designated SEQ ID:6928, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5091] Another function of GAM47 is therefore inhibition of FLJ12270 (Accession XP_290704.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12270.

[5092] FLJ12425 (Accession XP_098290.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ12425 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12425, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12425 BINDING SITE, designated SEQ ID:3483, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5093] Another function of GAM47 is therefore inhibition of FLJ12425 (Accession XP_098290.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12425.

[5094] FLJ12552 (Accession NP_073743.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ12552 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12552, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12552 BINDING SITE, designated SEQ ID:3923, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5095] Another function of GAM47 is therefore inhibition of FLJ12552 (Accession NP_073743.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12552.

[5096] FLJ12704 (Accession NP_079274.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ12704 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12704, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE, designated SEQ ID:871, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5097] Another function of GAM47 is therefore inhibition of FLJ12704 (Accession NP_079274.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704.

[5098] FLJ12788 (Accession NP_071937.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ12788 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12788, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12788 BINDING SITE, designated SEQ ID:2532, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5099] Another function of GAM47 is therefore inhibition of FLJ12788 (Accession NP_071937.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12788.

[5100] FLJ13154 (Accession NP_078874.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ13154 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13154, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13154 BINDING SITE, designated SEQ ID:17478, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5101] Another function of GAM47 is therefore inhibition of FLJ13154 (Accession NP_078874.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13154.

[5102] FLJ13204 (Accession NP_079037.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ13204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:7166, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[5103] Another function of GAM47 is therefore inhibition of FLJ13204 (Accession NP_079037.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204.

[5104] FLJ13710 (Accession NP_079093.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ13710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13710, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:18875, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5105] Another function of GAM47 is therefore inhibition of FLJ13710 (Accession NP_079093.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13710.

[5106] FLJ13855 (Accession NP_075567.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ13855 BINDING SITE1 and FLJ13855 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by FLJ13855, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13855 BINDING SITE1 and FLJ13855 BINDING SITE2, designated SEQ ID:5049 and SEQ ID:13447 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5107] Another function of GAM47 is therefore inhibition of FLJ13855 (Accession NP_075567.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13855.

[5108] FLJ14146 (Accession NP_078985.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ14146 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:888, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5109] Another function of GAM47 is therefore inhibition of

FLJ14146 (Accession NP_078985.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146.

[5110] FLJ14442 (Accession NP_116174.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ14442 BINDING SITE1 and FLJ14442 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ14442, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE1 and FLJ14442 BINDING SITE2, designated SEQ ID:8273 and SEQ ID:17024 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5111] Another function of GAM47 is therefore inhibition of FLJ14442 (Accession NP_116174.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442.

[5112] FLJ14751 (Accession NP_116223.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ14751 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14751, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14751 BINDING SITE, designated SEQ ID:3661, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5113] Another function of GAM47 is therefore inhibition of FLJ14751 (Accession NP_116223.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14751.

[5114] FLJ20060 (Accession NP_060115.3) is another GAM47 target gene, herein designated TARGET GENE. FLJ20060 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20060, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20060 BINDING SITE, designated SEQ ID:14321, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5115] Another function of GAM47 is therefore inhibition of FLJ20060 (Accession NP_060115.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20060.

[5116] FLJ20232 (Accession NP_061881.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ20232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:8193, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5117] Another function of GAM47 is therefore inhibition of FLJ20232 (Accession NP_061881.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232.

[5118] FLJ20400 (Accession NP_060274.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ20400 BINDING SITE1 and FLJ20400 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ20400, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20400 BINDING SITE1 and FLJ20400 BINDING SITE2, designated SEQ ID:12810 and

SEQ ID:4963 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5119] Another function of GAM47 is therefore inhibition of FLJ20400 (Accession NP_060274.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20400.

[5120] FLJ20489 (Accession NP_060312.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ20489 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20489, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20489 BINDING SITE, designated SEQ ID:7395, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5121] Another function of GAM47 is therefore inhibition of FLJ20489 (Accession NP_060312.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20489.

[5122] FLJ20758 (Accession NP_060422.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ20758

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20758, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20758 BINDING SITE, designated SEQ ID:19231, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5123] Another function of GAM47 is therefore inhibition of FLJ20758 (Accession NP_060422.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20758.

[5124] FLJ20813 (Accession NP_060431.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ20813 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20813 BINDING SITE, designated SEQ ID:11077, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5125] Another function of GAM47 is therefore inhibition of

FLJ20813 (Accession NP_060431.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20813.

[5126] FLJ20886 (Accession NP_079475.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ20886 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20886, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20886 BINDING SITE, designated SEQ ID:636, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5127] Another function of GAM47 is therefore inhibition of FLJ20886 (Accession NP_079475.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20886.

[5128] FLJ21596 (Accession NP_079099.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ21596 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21596, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ21596 BINDING SITE, designated SEQ ID:19872, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5129] Another function of GAM47 is therefore inhibition of FLJ21596 (Accession NP_079099.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21596.

[5130] FLJ22175 (Accession NP_079437.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ22175 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22175, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22175 BINDING SITE, designated SEQ ID:12089, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5131] Another function of GAM47 is therefore inhibition of FLJ22175 (Accession NP_079437.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22175.

[5132] FLJ22184 (Accession XP_300713.1) is another GAM47 tar-

get gene, herein designated TARGET GENE. FLJ22184 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22184 BINDING SITE, designated SEQ ID:8410, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5133] Another function of GAM47 is therefore inhibition of FLJ22184 (Accession XP_300713.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22184.

[5134] FLJ22301 (Accession NP_079112.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ22301 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22301, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22301 BINDING SITE, designated SEQ ID:889, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5135] Another function of GAM47 is therefore inhibition of FLJ22301 (Accession NP_079112.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22301.

[5136] FLJ22944 (Accession NP_079421.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ22944 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22944, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22944 BINDING SITE, designated SEQ ID:5374, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5137] Another function of GAM47 is therefore inhibition of FLJ22944 (Accession NP_079421.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22944.

[5138] FLJ23510 (Accession NP_078996.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ23510 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23510, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23510 BINDING SITE, designated SEQ ID:12934, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5139] Another function of GAM47 is therefore inhibition of FLJ23510 (Accession NP_078996.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23510.

[5140] FLJ30594 (Accession NP_694556.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ30594 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ30594, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30594 BINDING SITE, designated SEQ ID:2004, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5141] Another function of GAM47 is therefore inhibition of FLJ30594 (Accession NP_694556.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30594.

[5142] FLJ30681 (Accession XP_166291.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ30681 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30681, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30681 BINDING SITE, designated SEQ ID:8907, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5143] Another function of GAM47 is therefore inhibition of FLJ30681 (Accession XP_166291.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30681.

[5144] FLJ31052 (Accession NP_689591.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ31052 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31052, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31052 BINDING SITE, designated SEQ ID:18738, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[5145] Another function of GAM47 is therefore inhibition of FLJ31052 (Accession NP_689591.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31052.

[5146] FLJ31121 (Accession NP_653324.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ31121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31121 BINDING SITE, designated SEQ ID:12105, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5147] Another function of GAM47 is therefore inhibition of FLJ31121 (Accession NP_653324.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31121.

[5148] FLJ31614 (Accession NP_689786.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ31614 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31614, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31614 BINDING SITE, designated SEQ ID:3137, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5149] Another function of GAM47 is therefore inhibition of FLJ31614 (Accession NP_689786.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31614.

[5150] FLJ32115 (Accession NP_689534.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ32115 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32115 BINDING SITE, designated SEQ ID:17063, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5151] Another function of GAM47 is therefore inhibition of FLJ32115 (Accession NP_689534.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ32115.

[5152] FLJ32784 (Accession NP_653224.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ32784 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32784 BINDING SITE, designated SEQ ID:15892, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5153] Another function of GAM47 is therefore inhibition of FLJ32784 (Accession NP_653224.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32784.

[5154] FLJ33084 (Accession NP_689713.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ33084 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33084, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33084 BINDING SITE, designated SEQ ID:17824, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5155] Another function of GAM47 is therefore inhibition of FLJ33084 (Accession NP_689713.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33084.

[5156] FLJ33620 (Accession XP_087304.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ33620 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FLJ33620, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33620 BINDING SITE, designated SEQ ID:20089, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5157] Another function of GAM47 is therefore inhibition of FLJ33620 (Accession XP_087304.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33620.

[5158] FLJ33641 (Accession NP_689900.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ33641 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ33641, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33641 BINDING SITE, designated SEQ ID:460, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5159] Another function of GAM47 is therefore inhibition of FLJ33641 (Accession NP_689900.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33641.

[5160] FLJ36208 (Accession XP_208927.2) is another GAM47 target gene, herein designated TARGET GENE. FLJ36208 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ36208, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36208 BINDING SITE, designated SEQ ID:17922, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5161] Another function of GAM47 is therefore inhibition of FLJ36208 (Accession XP_208927.2) . Accordingly, utilities

of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36208.

[5162] FLJ36888 (Accession NP_849152.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ36888 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ36888, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36888 BINDING SITE, designated SEQ ID:2080, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5163] Another function of GAM47 is therefore inhibition of FLJ36888 (Accession NP_849152.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36888.

[5164] FLJ36888 (Accession XP_059053.7) is another GAM47 target gene, herein designated TARGET GENE. FLJ36888 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ36888, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of FLJ36888 BINDING SITE, designated SEQ ID:2080, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5165] Another function of GAM47 is therefore inhibition of FLJ36888 (Accession XP_059053.7) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36888.

[5166] FLJ37735 (Accession NP_787087.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ37735 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37735, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37735 BINDING SITE, designated SEQ ID:890, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5167] Another function of GAM47 is therefore inhibition of FLJ37735 (Accession NP_787087.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37735.

[5168] FLJ37927 (Accession NP_689836.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ37927

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37927 BINDING SITE, designated SEQ ID:832, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5169] Another function of GAM47 is therefore inhibition of FLJ37927 (Accession NP_689836.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37927.

[5170] FLJ38359 (Accession NP_689731.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ38359 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38359, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38359 BINDING SITE, designated SEQ ID:7421, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5171] Another function of GAM47 is therefore inhibition of

FLJ38359 (Accession NP_689731.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38359.

[5172] FLJ38705 (Accession NP_776193.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ38705 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38705, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38705 BINDING SITE, designated SEQ ID:13655, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5173] Another function of GAM47 is therefore inhibition of FLJ38705 (Accession NP_776193.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38705.

[5174] FLJ90254 (Accession NP_775962.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ90254 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ90254, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ90254 BINDING SITE, designated SEQ ID:4053, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5175] Another function of GAM47 is therefore inhibition of FLJ90254 (Accession NP_775962.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90254.

[5176] FLJ90583 (Accession NP_776189.1) is another GAM47 target gene, herein designated TARGET GENE. FLJ90583 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ90583, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90583 BINDING SITE, designated SEQ ID:4834, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5177] Another function of GAM47 is therefore inhibition of FLJ90583 (Accession NP_776189.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90583.

[5178] FOXP4 (Accession NP_612466.1) is another GAM47 target

gene, herein designated TARGET GENE. FOXP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOXP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOXP4 BINDING SITE, designated SEQ ID:4743, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5179] Another function of GAM47 is therefore inhibition of FOXP4 (Accession NP_612466.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXP4.

[5180] FRCP2 (Accession NP_715637.1) is another GAM47 target gene, herein designated TARGET GENE. FRCP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FRCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FRCP2 BINDING SITE, designated SEQ ID:7324, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5181] Another function of GAM47 is therefore inhibition of FRCP2 (Accession NP_715637.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRCP2.

[5182] Fucosyltransferase 6 (alpha (1,3) fucosyltransferase) (FUT6, Accession NP_000141.1) is another GAM47 target gene, herein designated TARGET GENE. FUT6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING SITE, designated SEQ ID:979, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5183] Another function of GAM47 is therefore inhibition of Fucosyltransferase 6 (alpha (1,3) fucosyltransferase) (FUT6, Accession NP_000141.1), a gene which is involved in the biosynthesis of the e- selectin ligand, sialyl- lewis x. catalyzes the transfer of fucose from gdp- beta- fucose to alpha- 2,3 sialylated substrates. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT6.

[5184] The function of FUT6 has been established by previous studies. The alpha- 1,3- fucosyltransferases constitute a large family of glycosyltransferases with a high degree of homology. The enzymes of this family comprise 3 main activity patterns called myeloid, plasma, and Lewis, based on their capacity to transfer alpha- L- fucose to distinct oligosaccharide acceptors, their sensitivity to N- ethyl- maleimide inhibition, their cation requirements, and their tissue- specific expression patterns. The different categories of alpha- 1,3- fucosyltransferases are sequentially expressed during embryo- fetal development.

[5185]

[5186] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5187] Brinkman- Van der Linden, E. C. M.; Mollicone, R.; Oriol, R.; Larson, G.; Van den Eijnden, D. H.; Van Dijk, W. : A missense mutation in the FUT6 gene results in total absence of alpha- 3- fucosylation of human alpha- 1- acid glycoprotein. J. Biol. Chem. 271: 14492- 14495, 1996. ; and

[5188] Cameron, H. S.; Szczepaniak, D.; Weston, B. W. : Expression of human chromosome 19p alpha- (1,3)- fucosyl-

transferase genes in normal tissues: alternative splicing, polyadenylation, and is.

[5189] Further studies establishing the function and utilities of FUT6 are found in John Hopkins OMIM database record ID 136836, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068704.1) is another GAM47 tar-get gene, herein designated TARGET GENE. GABBR1 BIND-ING SITE is a target binding site found in the 3` untrans-lated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-cleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:9955, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5190] Another function of GAM47 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068704.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[5191] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1,

Accession NP_068705.1) is another GAM47 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:9955, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5192] Another function of GAM47 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[5193] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_001461.1) is another GAM47 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of GABBR1 BINDING SITE, designated SEQ ID:9955, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5194] Another function of GAM47 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_001461.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[5195] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068703.1) is another GAM47 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:9955, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5196] Another function of GAM47 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068703.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with GABBR1.

[5197] Glutamate decarboxylase 1 (brain, 67kda) (GAD1, Accession NP_000808.1) is another GAM47 target gene, herein designated TARGET GENE. GAD1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GAD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAD1 BINDING SITE, designated SEQ ID:10685, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5198] Another function of GAM47 is therefore inhibition of Glutamate decarboxylase 1 (brain, 67kda) (GAD1, Accession NP_000808.1), a gene which catalyzes the conversion of glutamic acid to gamma- aminobutyric acid. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAD1.

[5199] The function of GAD1 has been established by previous studies. Using a genomic probe from a human fetal brain library, Sparkes et al. (1987) probed the DNA of a mouse/human somatic cell hybrid panel and assigned the GAD

gene to human chromosome 2. Kelly et al. (1992) confirmed the assignment of GAD1 to chromosome 2, using PCR to amplify specifically the human sequence in rodent/human somatic cell hybrid DNAs. They also reported the full nucleotide sequence of the cDNA and the deduced amino acid sequence. Bu et al. (1992) mapped the GAD1 gene to 2q31 by in situ hybridization of fluorescently labeled GAD probes to human chromosomes. They demonstrated that the GAD1 gene encodes a polypeptide of 67,000 molecular weight, with 594 amino acid residues. The GAD2 gene (OMIM Ref. No. 138275), located on 10p11.23, encodes a polypeptide of 65,000 molecular weight (GAD65), with 585 amino acid residues. Brilliant et al. (1990) showed by Southern analysis of mouse- hamster hybrid cells and by interspecific backcrosses and recombinant inbred strains that the mouse equivalent (Gad1) is located on chromosome 2 and that an apparent pseudogene is located on mouse chromosome 10. The mouse Gad1 locus is part of a conserved homology between mouse chromosome 2 and human 2q. By in situ hybridization, Edelhoff et al. (1993) also assigned GAD1 to human 2q31 and to mouse chromosome 2D in a known region of conservation between human and mouse.

[5200] Animal model experiments lend further support to the function of GAD1. The remaining exon- intron boundaries occur at identical positions in the 2 cDNAs, suggesting that they derive from a common ancestral GAD gene. In addition to its role as an inhibitory neurotransmitter, GABA is presumed to be involved in the development and plasticity of the nervous system. GABA is synthesized by glutamic acid decarboxylase, but the respective roles of its 2 isoforms, GAD65 and GAD67, had not been determined. Asada et al. (1996, 1997) undertook the selective elimination of each GAD isoform by gene targeting to clarify this issue. Asada et al. (1996) found that GAD65 -/- mice showed no change in brain GABA content or animal behavior, except for a slight increase in susceptibility to seizures. Asada et al. (1997) produced GAD67 -/- mice. These mice were born at the expected frequency but died of severe cleft palate during the first morning after birth. GAD activities and GABA contents were reduced to 20 and 7%, respectively, in the cerebral cortex of the newborn GAD67 -/- mice. Their brains, however, did not show any discernible defects. Previous pharmacologic and genetic investigations suggested the involvement of GABA in palate formation, but this was the first demonstration

of a role for GAD67- derived GABA in the development of nonneural tissue. Independently, Condie et al. (1997) found defects in the formation of the palate in mice with a targeted mutation in the gene encoding GAD67. Previous observations had suggested a role of GABA in palate development. Analysis of mice with mutations in the beta- 3 gamma- GABA receptor (GABRB3; 137192) had demonstrated that these mutations are associated with cleft secondary palate in mice. The phenotype in the GABRB3 mutants showed that this gene is somehow involved in palate development but did not demonstrate that GABA is the ligand involved in this particular function. The results of Condie et al. (1997), demonstrating a similar phenotype between the receptor and ligand mutations, demonstrated a role for GABA signaling in normal palate development.

[5201] It is appreciated that the abovementioned animal model for GAD1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[5202] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5203] Asada, H.; Kawamura, Y.; Maruyama, K.; Kume, H.; Ding,

R.- G.; Ji, F. Y.; Kanbara, N.; Kuzume, H.; Sanbo, M.; Yagi, T.; Obata, K. : Mice lacking the 65 kDa isoform of glutamic acid decarboxylase (GAD65) maintain normal levels of GAD67 and GABA in their brains but are susceptible to seizures. Biochem. Biophys. Res. Commun. 229: 891-895, 1996. ; and

[5205] Further studies establishing the function and utilities of GAD1 are found in John Hopkins OMIM database record ID 605363, and in cited publications listed in Table 5, which are hereby incorporated by reference.Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 10 (galnac-t10) (GALNT10, Accession NP_060010.2) is another GAM47 target gene, herein designated TARGET GENE. GALNT10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GALNT10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALNT10 BINDING SITE, designated SEQ ID:8570, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5206] Another function of GAM47 is therefore inhibition of Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 10 (galnac-t10) (GALNT10, Accession NP_060010.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT10.

[5207] Galactose-1-phosphate uridylyltransferase (GALT, Accession NP_667343.1) is another GAM47 target gene, herein designated TARGET GENE. GALT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GALT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALT BINDING SITE, designated SEQ ID:14804, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5208] Another function of GAM47 is therefore inhibition of Galactose-1-phosphate uridylyltransferase (GALT, Accession NP_667343.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with GALT.

[5209] Galactose-1-phosphate uridylyltransferase (GALT, Accession NP_667342.1) is another GAM47 target gene, herein designated TARGET GENE. GALT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GALT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALT BINDING SITE, designated SEQ ID:14804, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5210] Another function of GAM47 is therefore inhibition of Galactose-1-phosphate uridylyltransferase (GALT, Accession NP_667342.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALT.

[5211] Giant axonal neuropathy (gigaxonin) (GAN, Accession NP_071324.1) is another GAM47 target gene, herein designated TARGET GENE. GAN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:1594, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5212] Another function of GAM47 is therefore inhibition of Giant axonal neuropathy (gigaxonin) (GAN, Accession NP_071324.1), a gene which plays an important role in neurofilament architecture. and therefore may be associated with Giant axonal neuropathy 1. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Giant axonal neuropathy 1., and of other diseases and clinical conditions associated with GAN.

[5213] The function of GAN has been established by previous studies. Giant axonal neuropathy (GAN; 256850), a severe autosomal recessive sensorineural neuropathy affecting both the peripheral nerves and the central nervous system, is characterized by neurofilament accumulation, leading to segmental distention of axons. The neuropathy is part of a generalized disorganization of the cytoskeletal intermediate filaments (IFs), to which neurofilaments belong, as abnormal aggregation of multiple tissue- specific IFs has been reported in this disorder: vimentin (VIM; 193060) in endothelial cells, Schwann cells, and cultured

skin fibroblasts, and glial fibrillary acidic protein (GFAP; 137780) in astrocytes (Prineas et al., 1976; Pena, 1982; Bousquet et al., 1996). Keratin intermediate filaments also seem to be altered, as most patients present characteristic curly or kinky hairs (Treiber- Held et al., 1994). Bomont et al. (2000) used a positional cloning approach to isolate a novel, ubiquitously expressed gene that encoded a protein they named gigaxonin and contained mutations associated with giant axonal neuropathy. Gigaxonin contains an N- terminal BTB (broad- complex, tramtrack, and bric- a- brac) domain followed by 6 kelch repeats, which were predicted to adopt a beta- propeller shape. Distantly related proteins sharing a similar domain organization have various functions associated with the cytoskeleton, predicting that gigaxonin is a novel and distinct cytoskeletal protein that may represent a general pathologic target for other neurodegenerative disorders with alterations in the neurofilament network.

[5214]

[5215] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5216] Bomont, P.; Cavalier, L.; Blondeau, F.; Ben Hamida, C.; Be-

lal, S.; Tazir, M.; Demir, E.; Topaloglu, H.; Korinthenberg, R.; Tuysuz, B.; Landrieu, P.; Hentati, F.; Koenig, M. : The gene encoding gigaxonin, a new member of the cytoskeletal BTB/kelch repeat family, is mutated in giant axonal neuropathy. Nature Genet. 26: 370- 374, 2000. ; and

[5217] Bousquet, O.; Basseville, M.; Vila- Porcile, E.; Billette de Villemeur, T.; Hauw, J.- J.; Landrieu, P.; Portier, M.- M. : Aggregation of a subpopulation of vimentin filaments in cultured.

[5218] Further studies establishing the function and utilities of GAN are found in John Hopkins OMIM database record ID 605379, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gata binding protein 2 (GATA2, Accession NP_116027.2) is another GAM47 target gene, herein designated TARGET GENE. GATA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GATA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:3495, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5219] Another function of GAM47 is therefore inhibition of Gata binding protein 2 (GATA2, Accession NP_116027.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2.

[5220] GBP5 (Accession NP_443174.1) is another GAM47 target gene, herein designated TARGET GENE. GBP5 BINDING SITE1 and GBP5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GBP5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GBP5 BINDING SITE1 and GBP5 BINDING SITE2, designated SEQ ID:14365 and SEQ ID:10024 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5221] Another function of GAM47 is therefore inhibition of GBP5 (Accession NP_443174.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBP5.

[5222] Gcn5 general control of amino-acid synthesis 5-like 2 (yeast) (GCN5L2, Accession NP_066564.1) is another GAM47 target gene, herein designated TARGET GENE.

GCN5L2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GCN5L2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCN5L2 BINDING SITE, designated SEQ ID:1805, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5223] Another function of GAM47 is therefore inhibition of Gcn5 general control of amino-acid synthesis 5-like 2 (yeast) (GCN5L2, Accession NP_066564.1), a gene which functions as a histone acetyltransferase (hat) to promote transcriptional activation. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCN5L2.

[5224] The function of GCN5L2 has been established by previous studies. The ability of DNA- bound transcriptional activator proteins to enhance the initiation rate of RNA polymerase II- mediated gene transcription hinges on their potential to interact functionally with the general transcription machinery bound at the basal promoter. Candau et al. (1996) identified expressed sequence tags of possible human homologs of the yeast transcriptional activator

proteins ADA2 and GCN5. Full- length cDNAs, designated TADA2L (OMIM Ref. No. 602276) and GCN5L2, were isolated from testis. The GCN5L2 predicted 427- amino acid protein is 43% identical to the yeast protein. GCN5L2 was shown to function experimentally as an adaptor in a human cell line. Yang et al. (1996) also cloned GCN5L2; their clone had an additional 49 N- terminal amino acids. Yang et al. (1996) reported that GCN5L2 has significant histone acetyltransferase activity with core histones, but not with nucleosome core particles. By Northern blot analysis, Carter et al. (1997) detected a 4.0- kb GCN5L2 message in all tissues examined, with most abundant expression in ovary.

[5225] Animal model experiments lend further support to the function of GCN5L2. Histone acetyltransferases regulate transcription. Gcn5 (encoded by Gcn5l2) and Pcaf (OMIM Ref. No. 602305), histone acetyltransferases in the mouse, share similar sequences and enzymatic activities. Both interact with p300 and CBP, encoded by Ep300 (OMIM Ref. No. 602700) and Crebbp (OMIM Ref. No. 600140), respectively, which are 2 other histone acetyltransferases that integrate multiple signaling pathways. Xu et al. (2000) showed that the gene Pcaf is dispensable in mice. In con-

trast, Gcn5l2- null embryos died during embryogenesis. Growth was severely retarded by day 8.5 postcoitum, and embryos failed to form dorsal mesoderm lineages, including chordamesoderm and paraxial mesoderm. Loss of dorsal mesoderm lineages was due to a high incidence of apoptosis in the Gcn5l2 mutants that began before the onset of morphologic abnormalities. Embryos null for both Gcn5l2 and Pcaf showed even more severe defects, indicating that these histone acetyltransferases have overlapping function during embryogenesis.

[5226] It is appreciated that the abovementioned animal model for GCN5L2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[5227] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5228] Candau, R.; Moore, P. A.; Wang, L.; Barlev, N.; Ying, C. Y.; Rosen, C. A.; Berger, S. L. : Identification of human proteins functionally conserved with the yeast putative adaptors ADA2 and GCN5. Molec. Cell. Biol. 16: 593- 602, 1996. ; and

[5229] Carter, K. C.; Wang, L.; Shell, B. K.; Zamir, I.; Berger, S. L.;

Moore, P. A. : The human transcriptional adaptor genes TADA2L and GCN5L2 colocalize to chromosome 17q12-q21 and display.

[5230] Further studies establishing the function and utilities of GCN5L2 are found in John Hopkins OMIM database record ID 602301, and in cited publications listed in Table 5, which are hereby incorporated by reference.Growth differentiation factor 1 (GDF1, Accession NP_001483.2) is another GAM47 target gene, herein designated TARGET GENE. GDF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GDF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GDF1 BINDING SITE, designated SEQ ID:13970, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5231] Another function of GAM47 is therefore inhibition of Growth differentiation factor 1 (GDF1, Accession NP_001483.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDF1.

[5232] Glioma tumor suppressor candidate region gene 1

(GLTSCR1, Accession NP_056526.1) is another GAM47 target gene, herein designated TARGET GENE. GLTSCR1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GLTSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GLTSCR1 BINDING SITE, designated SEQ ID:18169, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5233] Another function of GAM47 is therefore inhibition of Glioma tumor suppressor candidate region gene 1 (GLTSCR1, Accession NP_056526.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLTSCR1.

[5234] Guanosine monophosphate reductase (GMPR, Accession NP_006868.2) is another GAM47 target gene, herein designated TARGET GENE. GMPR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GMPR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GMPR BINDING SITE, designated

SEQ ID:9389, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5235] Another function of GAM47 is therefore inhibition of Guanosine monophosphate reductase (GMPR, Accession NP_006868.2), a gene which functions in the conversion and maintaining the intracellular balance of a and g nucleotides. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPR.

[5236] The function of GMPR has been established by previous studies. Kanno et al. (1989) suggested that red cell G6PD is a fusion protein consisting of an NH2- terminus encoded by chromosome 6 and a COOH- portion coded by an X chromosome. This was subsequently disproved by Beutler et al. (1990) and by Mason et al. (1990) who also presented evidence that the gene that had been mapped to chromosome 6 by Southern hybridization to flow-sorted chromosomes and to somatic cell hybrids was in fact GMP reductase. By fluorescence in situ hybridization, Murano et al. (1994) mapped the GMPR gene to 6p23. Henikoff and Smith (1989) had pointed out similarities between the sequence described by Kanno et al. (1989) for the chromosome 6- encoded gene and the sequence

of E. coli GMP reductase. Kondoh et al. (1991) further delineated the structure of the gene. It spans about 50 kb and is composed of 9 exons, which encode 345 amino acid residues. The gene contains 2 potential SpI binding sites within exon 1, and a functional, atypical polyadenylation signal in exon 9.

[5237]

[5238] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5239] Kanno, H.; Huang, I.- Y.; Kan, Y. W.; Yoshida, A. : Two structural genes on different chromosomes are required for encoding the major subunit of human red cell glucose- 6- phosphate dehydrogenase. Cell 58: 595- 606, 1989. ; and

[5240] Murano, I.; Tsukahara, M.; Kajii, T.; Yoshida, A. : Mapping of the human guanosine monophosphate reductase gene (GMPR) to chromosome 6p23 by fluorescence in situ hybridization. Genomics.

[5241] Further studies establishing the function and utilities of GMPR are found in John Hopkins OMIM database record ID 139265, and in cited publications listed in Table 5, which are hereby incorporated by reference.Guanine nucleotide

binding protein (g protein), alpha 15 (gq class) (GNA15, Accession NP_002059.1) is another GAM47 target gene, herein designated TARGET GENE. GNA15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNA15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNA15 BINDING SITE, designated SEQ ID:1917, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5242] Another function of GAM47 is therefore inhibition of Guanine nucleotide binding protein (g protein), alpha 15 (gq class) (GNA15, Accession NP_002059.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA15.

[5243] Glycoprotein ib (platelet), alpha polypeptide (GP1BA, Accession NP_000164.1) is another GAM47 target gene, herein designated TARGET GENE. GP1BA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GP1BA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GP1BA BINDING SITE, designated SEQ ID:19965, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5244] Another function of GAM47 is therefore inhibition of Glycoprotein ib (platelet), alpha polypeptide (GP1BA, Accession NP_000164.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP1BA.

[5245] G protein-coupled receptor 74 (GPR74, Accession NP_444264.1) is another GAM47 target gene, herein designated TARGET GENE. GPR74 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GPR74, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR74 BINDING SITE, designated SEQ ID:16837, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5246] Another function of GAM47 is therefore inhibition of G protein-coupled receptor 74 (GPR74, Accession

NP_444264.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR74.

[5247] G protein-coupled receptor 92 (GPR92, Accession NP_065133.1) is another GAM47 target gene, herein designated TARGET GENE. GPR92 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR92, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR92 BINDING SITE, designated SEQ ID:17507, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5248] Another function of GAM47 is therefore inhibition of G protein-coupled receptor 92 (GPR92, Accession NP_065133.1), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR92.

[5249] The function of GPR92 has been established by previous studies. Lee et al. (2001) identified GPR92, which they designated GPR93, in a genomic database using the se-

quences of the cysteinyl leukotriene- 2 receptor (OMIM Ref. No. 605666) as query. GPR92 encodes a deduced 372- amino acid protein that shares 36 to 40% sequence identity in the transmembrane regions with the G protein-coupled purinergic receptor P2Y5, GPR23 (OMIM Ref. No. 300086), and GPR17 (OMIM Ref. No. 603071). Lee et al. (2001) mapped the GPR92 gene to chromosome 12 based on sequence similarity between the GPR92 sequence and a BAC clone (GenBank AC006087) localized to chromosome 12. The ADHR Consortium (2000) identified GPR92 near the FGF23 gene on chromosome 12p13.

[5250]

[5251] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5252] Lee, D. K.; Nguyen, T.; Lynch, K. R.; Cheng, R.; Vanti, W. B.; Arkhitko, O.; Lewis, T.; Evans, J. F.; George, S. R.; O'Dowd, B. F. : Discovery and mapping of ten novel G protein- coupled receptor genes. Gene 275: 83- 91, 2001. ; and

[5253] The ADHR Consortium : Autosomal dominant hypophosphataemic rickets is associated with mutations in FGF23. Nature Genet. 26: 345- 348, 2000.

[5254] Further studies establishing the function and utilities of GPR92 are found in John Hopkins OMIM database record ID 606926, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glutathione s-transferase m5 (GSTM5, Accession NP_000842.2) is another GAM47 target gene, herein designated TARGET GENE. GSTM5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GSTM5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSTM5 BINDING SITE, designated SEQ ID:10604, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5255] Another function of GAM47 is therefore inhibition of Glutathione s-transferase m5 (GSTM5, Accession NP_000842.2), a gene which conjugates reduced glutathione to a wide number of exogenous and endogenous hydrophobic electrophiles. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSTM5.

[5256] The function of GSTM5 has been established by previous studies. The glutathione S- transferases (GSTs) are

dimeric enzymes that metabolize a broad range of xenobiotics and carcinogens. They are encoded by several multigene families. See GSTM1 (OMIM Ref. No. 138350) for additional background. By screening a human frontal cortex cDNA library with a rat cDNA that cross- hybridized with other rodent and human mu class GST cDNAs, Takahashi et al. (1993) isolated a cDNA encoding GSTM5. Northern blot analysis revealed that GSTM5 is expressed primarily in brain and lung and to a lesser extent in heart. The GSTM5 gene encodes a predicted 217-amino acid protein. By Western blot analysis using antibodies against the unique C- terminal region of GSTM5, Takahashi et al. (1993) detected GSTM5 in brain and testis but not liver.

[5257]

[5258] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5259] Pearson, W. R.; Vorachek, W. R.; Xu, S.; Berger, R.; Hart, I.; Vannais, D.; Patterson, D. : Identification of class- mu glutathione transferase genes GSTM1- GSTM5 on human chromosome 1p13. Am. J. Hum. Genet. 53: 220- 233, 1993. ; and

[5260] Takahashi, Y.; Campbell, E. A.; Hirata, Y.; Takayama, T.; Listowsky, I. : A basis for differentiating among the multiple human mu- glutathione S- transferases and molecular cloning of bra.

[5261] Further studies establishing the function and utilities of GSTM5 are found in John Hopkins OMIM database record ID 138385, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hyaluronan binding protein 2 (HABP2, Accession NP_004123.1) is another GAM47 target gene, herein designated TARGET GENE. HABP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HABP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HABP2 BINDING SITE, designated SEQ ID:14769, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5262] Another function of GAM47 is therefore inhibition of Hyaluronan binding protein 2 (HABP2, Accession NP_004123.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP2.

[5263] Histone deacetylase 5 (HDAC5, Accession NP_631944.1) is another GAM47 target gene, herein designated TARGET GENE. HDAC5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HDAC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HDAC5 BINDING SITE, designated SEQ ID:1806, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5264] Another function of GAM47 is therefore inhibition of Histone deacetylase 5 (HDAC5, Accession NP_631944.1), a gene which is responsible for the deacetylation of lysine residues on the n- terminal part of the core histones and mediate transcriptional regulation. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC5.

[5265] The function of HDAC5 has been established by previous studies. Members of the myocyte enhancer factor- 2 (MEF2A; 600660) family of transcription factors associate with myogenic basic helix- loop- helix transcription factors such as MYOD1 (OMIM Ref. No. 159970) to activate

skeletal myogenesis. MEF2 proteins also interact with the class II histone deacetylases HDAC4 and HDAC5, resulting in repression of MEF2- dependent genes. Execution of the muscle differentiation program requires release of MEF2 from repression by HDACs, which are expressed constitutively in myoblasts and myotubes. McKinsey et al. (2000) demonstrated that HDAC5 shuttles from the nucleus to the cytoplasm when myoblasts are triggered to differentiate. Calcium/calmodulin- dependent protein kinase (CAMK1; 604998) signaling, which stimulates myogenesis and prevents formation of MEF2- HDAC complexes, also induces nuclear export of HDAC4 and HDAC5 by phosphorylation of these transcriptional repressors. An HDAC5 mutant lacking 2 CAMK phosphorylation sites is resistant to CAMK- mediated nuclear export and acts as a dominant inhibitor of skeletal myogenesis, whereas a cytoplasmic HDAC5 mutant is unable to block efficiently the muscle differentiation program. McKinsey et al. (2000) concluded that their results highlight a mechanism for transcriptional regulation through signal and differentiation-dependent nuclear export of a chromatin- remodeling enzyme, and suggest that nucleocytoplasmic trafficking of HDACs is involved in the control of cellular differentiation.

Nagase et al. (1998) isolated a partial cDNA encoding HDAC5, which they called KIAA0600, from a brain cDNA library. RT- PCR analysis detected HDAC5 expression in all tissues tested, with relatively low expression in spleen and pancreas. By serologic analysis of recombinant colon cancer cDNA expression libraries, Scanlan et al. (1998) identified a partial cDNA encoding HDAC5, which they called NYCO9. Northern blot and RT- PCR analysis indicated weak but universal expression of a 3.7- kb HDAC5 transcript. Serologic analysis demonstrated that 5 of 29 colon cancer patients had antibodies to HDAC5.

[5266]

[5267] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5268] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 5: 31- 39, 1998. ; and

[5269] McKinsey, T. A.; Zhang, C.- L.; Lu, J.; Olson, E. N. : Signal-dependent nuclear export of a histone deacetylase regu-

lates muscle differentiation. Nature 408: 106- 111, 2000.

[5270] Further studies establishing the function and utilities of HDAC5 are found in John Hopkins OMIM database record ID 605315, and in cited publications listed in Table 5, which are hereby incorporated by reference.HES2 (Accession XP_290879.1) is another GAM47 target gene, herein designated TARGET GENE. HES2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HES2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HES2 BINDING SITE, designated SEQ ID:4547, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5271] Another function of GAM47 is therefore inhibition of HES2 (Accession XP_290879.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HES2.

[5272] Hexosaminidase a (alpha polypeptide) (HEXA, Accession NP_000511.1) is another GAM47 target gene, herein designated TARGET GENE. HEXA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by HEXA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEXA BINDING SITE, designated SEQ ID:13753, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5273] Another function of GAM47 is therefore inhibition of Hexosaminidase a (alpha polypeptide) (HEXA, Accession NP_000511.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEXA.

[5274] Hepatocyte growth factor-regulated tyrosine kinase substrate (HGS, Accession NP_004703.1) is another GAM47 target gene, herein designated TARGET GENE. HGS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HGS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HGS BINDING SITE, designated SEQ ID:10117, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5275] Another function of GAM47 is therefore inhibition of Hep-

atocyte growth factor-regulated tyrosine kinase substrate (HGS, Accession NP_004703.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGS.

[5276] Hira interacting protein 3 (HIRIP3, Accession NP_003600.2) is another GAM47 target gene, herein designated TARGET GENE. HIRIP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HIRIP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIRIP3 BINDING SITE, designated SEQ ID:12016, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5277] Another function of GAM47 is therefore inhibition of Hira interacting protein 3 (HIRIP3, Accession NP_003600.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIRIP3.

[5278] Major histocompatibility complex, class ii, do beta (HLA-DOB, Accession NP_002111.1) is another GAM47 target gene, herein designated TARGET GENE. HLA-DOB BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by HLA-DOB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HLA-DOB BINDING SITE, designated SEQ ID:11289, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5279] Another function of GAM47 is therefore inhibition of Major histocompatibility complex, class ii, do beta (HLA-DOB, Accession NP_002111.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-DOB.

[5280] Homeo box a3 (HOXA3, Accession NP_705896.1) is another GAM47 target gene, herein designated TARGET GENE. HOXA3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by HOXA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXA3 BINDING SITE, designated SEQ ID:2711, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5281] Another function of GAM47 is therefore inhibition of Homeo box a3 (HOXA3, Accession NP_705896.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA3.

[5282] Homeo box b8 (HOXB8, Accession NP_076921.1) is another GAM47 target gene, herein designated TARGET GENE. HOXB8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXB8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB8 BINDING SITE, designated SEQ ID:1287, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5283] Another function of GAM47 is therefore inhibition of Homeo box b8 (HOXB8, Accession NP_076921.1), a gene which is part of a developmental regulatory system. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB8.

[5284] The function of HOXB8 has been established by previous studies. Using RT- PCR and in situ hybridization, Greer

and Capecchi (2002) detected Hoxb8 expression in regions of the adult mouse central nervous system including the cervical spinal cord, brainstem, forebrain, olfactory bulb, basal ganglia, hippocampus, cortex, and cerebellum. Greer and Capecchi (2002) noted that the behavior of Hoxb8 knockout mice is not unlike that of humans suffering from the obsessive- compulsive spectrum disorder (OCD) trichotillomania. Consistent with this, they detected expression of Hoxb8 in regions of the CNS known as the 'OCD- circuit,' where OCD patients are thought to have abnormal metabolic activity. They hypothesized that trichotillomania may arise from a misregulation of an innate autogrooming behavior and presented the Hoxb8 mutant mice as a model of OCD- like phenotypes.

[5285] Animal model experiments lend further support to the function of HOXB8. The grooming phenotype in Hoxb8 knockout mice reported by Greer and Capecchi (2002) differs significantly from the axial skeletal defects and abnormal forearm clasping reflex reported for Hoxb8 mutant mice generated by van den Akker et al. (1999). Greer and Capecchi (2002) argued that the skeletal and forelimb defects observed by van den Akker et al. (1999) were due to the presence of the bacterial lacZ gene in the mutant

mice. Greer and Capecchi (2002) similarly concluded that skeletal defects observed in one of their Hoxb8 mutant lines were due to the presence of a bacterial neo(r) gene in the Hoxb8 locus interfering with the expression of neighboring Hox genes.

[5286] It is appreciated that the abovementioned animal model for HOXB8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[5287] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5288] Greer, J. M.; Capecchi, M. R. : Hoxb8 is required for normal grooming behavior in mice. Neuron 33: 23- 34, 2002. ; and

[5289] van den Akker, E.; Reijnen, M.; Korving, J.; Brouwer, A.; Meijlink, F.; Deschamps, J. : Targeted inactivation of Hoxb8 affects survival of a spinal ganglion and causes aberrant limb re.

[5290] Further studies establishing the function and utilities of HOXB8 are found in John Hopkins OMIM database record ID 142963, and in cited publications listed in Table 5, which are hereby incorporated by reference.Histamine re-

ceptor h1 (HRH1, Accession NP_000852.1) is another GAM47 target gene, herein designated TARGET GENE. HRH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HRH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRH1 BINDING SITE, designated SEQ ID:16395, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5291] Another function of GAM47 is therefore inhibition of Histamine receptor h1 (HRH1, Accession NP_000852.1), a gene which stimulates the synthesis of inositol phosphate. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH1.

[5292] The function of HRH1 has been established by previous studies. Histamine is a ubiquitous messenger molecule released from mast cells, enterochromaffin- like cells, and neurons. Its various actions are mediated by 3 pharmacologically defined receptors termed the H1, H2 (OMIM Ref. No. 142703), and H3 (OMIM Ref. No. 604525) receptors. The H1 receptor was the first member of this family to be

pharmacologically defined with the design of selective antagonists, the 'antihistamines,' which are used to treat allergic and inflammatory reactions. The H1 receptor is expressed by various peripheral tissues, such as smooth muscle, and by neurons in the brain, where histamine may be involved in the control of wakefulness, mood, and hormone secretion. Yamashita et al. (1991) cloned a bovine H1 receptor cDNA and established its nucleotide sequence. Its homology with the corresponding sequence of other receptors confirmed that it belongs to the superfamily of receptors coupled with G proteins with 7 putative transmembrane domains. In addition to their expression in neuronal, gastric, and muscular tissue, the G protein- coupled receptors HRH1 and HRH2 are also expressed on T- helper lymphocytes and trigger different intracellular events upon activation. Using flow cytometric analysis, Jutel et al. (2001) demonstrated that histamine binds more strongly to Th1 than to Th2 cells. Flow cytometry and RT- PCR analysis showed that HRH1 is predominantly expressed on Th1 cells in an IL3 (OMIM Ref. No. 147740)- upregulatable manner, while HRH2 is predominant on Th2 cells. Stimulation of naive, CD45RA+ (see OMIM Ref. No. 151460) T cells with IL12 (OMIM Ref. No.

161560) resulted in preferential expression of HRH1, but stimulation with IL4 (OMIM Ref. No. 147780) resulted in suppressed expression of HRH1, demonstrating that mature CD45RO+ Th1 and Th2 lymphocytes preferentially but not exclusively express HRH1 and HRH2, and that HRH1 and HRH2 are regulated by cytokines present in the immune environment. Histamine stimulation of Th1 cells resulted in significant calcium flux that could be blocked by an HRH1 antagonist, while stimulation of Th2 cells led to cAMP formation that could be blocked by an HRH2, but not an HRH1, antagonist. Furthermore, histamine enhanced Th1 but inhibited Th2 responses to anti- CD3. Histamine also enhanced peripheral blood mononuclear cell responses in sensitized individuals to a predominantly Th1 antigen, but suppressed responses to Th2 allergens.

[5293] Animal model experiments lend further support to the function of HRH1. Ma et al. (2002) noted that pertussis toxin (PTX) elicits a range of responses in mice, including sensitization to vasoactive amines (VAAS) and increased vascular permeability subsequent to PTX- induced changes in vascular endothelial cells. Susceptible mouse strains die from hypotensive and hypovolemic shock on vasoactive amine challenge, whereas resistant strains do

not. This hypersensitivity is controlled by an autosomal dominant locus, designated Bphs, localized to mouse chromosome 6. Using positional cloning, Ma et al. (2002) linked the Bphs locus to Hrh1. Mice lacking Hrh1 were protected from VAAS hypersensitivity, as well as from experimental allergic encephalomyelitis and experimental autoimmune orchitis. Sequence analysis showed that leu263- to- pro (L263P), met313- to- val (M313V), and ser331- to- pro (S331P) polymorphisms were associated with resistance to vasoactive amine challenge. The authors concluded that these Hrh1 alleles control both the autoimmune T- cell and vascular responses regulated by histamine after PTX sensitization.

[5294] It is appreciated that the abovementioned animal model for HRH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[5295] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5296] Jutel, M.; Watanabe, T.; Klunker, S.; Akdis, M.; Thomet, O. A. R.; Malolepszy, J.; Zak- Nejmark, T.; Koga, R.; Kobayashi, T.; Blaser, K.; Akdis, C. A. : Histamine regu-

lates T- cell and antibody responses by differential expression of H1 and H2 receptors. Nature 413: 420- 425, 2001. ; and

[5298] Further studies establishing the function and utilities of HRH1 are found in John Hopkins OMIM database record ID 600167, and in cited publications listed in Table 5, which are hereby incorporated by reference.Heparan sulfate 2-o-sulfotransferase 1 (HS2ST1, Accession NP_036394.1) is another GAM47 target gene, herein designated TARGET GENE. HS2ST1 BINDING SITE1 and HS2ST1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HS2ST1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE1 and HS2ST1 BINDING SITE2, designated SEQ ID:2206 and SEQ ID:10600 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5299] Another function of GAM47 is therefore inhibition of Heparan sulfate 2-o-sulfotransferase 1 (HS2ST1, Accession NP_036394.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1.

[5300] Heparan sulfate (glucosamine) 3-o-sulfotransferase 4 (HS3ST4, Accession XP_056254.4) is another GAM47 target gene, herein designated TARGET GENE. HS3ST4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HS3ST4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HS3ST4 BINDING SITE, designated SEQ ID:3789, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5301] Another function of GAM47 is therefore inhibition of Heparan sulfate (glucosamine) 3-o-sulfotransferase 4 (HS3ST4, Accession XP_056254.4) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST4.

[5302] HSD3B7 (Accession NP_079469.2) is another GAM47 target gene, herein designated TARGET GENE. HSD3B7 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSD3B7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSD3B7 BINDING SITE, designated SEQ ID:17703, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5303] Another function of GAM47 is therefore inhibition of HSD3B7 (Accession NP_079469.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSD3B7.

[5304] Hiv-1 tat interactive protein, 60kda (HTATIP, Accession NP_006379.1) is another GAM47 target gene, herein designated TARGET GENE. HTATIP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTATIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTATIP BINDING SITE, designated SEQ ID:10365, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5305] Another function of GAM47 is therefore inhibition of Hiv-1 tat interactive protein, 60kda (HTATIP, Accession NP_006379.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTATIP.

[5306] Hypoxia up-regulated 1 (HYOU1, Accession NP_006380.1) is another GAM47 target gene, herein designated TARGET GENE. HYOU1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HYOU1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HYOU1 BINDING SITE, designated SEQ ID:10294, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5307] Another function of GAM47 is therefore inhibition of Hypoxia up-regulated 1 (HYOU1, Accession NP_006380.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYOU1.

[5308] HYPB (Accession NP_036403.1) is another GAM47 target gene, herein designated TARGET GENE. HYPB BINDING SITE is a target binding site found in the 3` untranslated

region of multiple transcripts of mRNA encoded by HYPB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HYPB BINDING SITE, designated SEQ ID:10651, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5309] Another function of GAM47 is therefore inhibition of HYPB (Accession NP_036403.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYPB.

[5310] Immune associated nucleotide 4 like 1 (mouse) (IAN4L1, Accession NP_060854.2) is another GAM47 target gene, herein designated TARGET GENE. IAN4L1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAN4L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IAN4L1 BINDING SITE, designated SEQ ID:18040, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5311] Another function of GAM47 is therefore inhibition of Im-

mune associated nucleotide 4 like 1 (mouse) (IAN4L1, Accession NP_060854.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IAN4L1.

[5312] IBA2 (Accession NP_113614.1) is another GAM47 target gene, herein designated TARGET GENE. IBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IBA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IBA2 BINDING SITE, designated SEQ ID:6376, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5313] Another function of GAM47 is therefore inhibition of IBA2 (Accession NP_113614.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IBA2.

[5314] Interleukin 1 receptor-like 1 (IL1RL1, Accession NP_775661.1) is another GAM47 target gene, herein designated TARGET GENE. IL1RL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL1RL1, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL1RL1 BINDING SITE, designated SEQ ID:1862, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5315] Another function of GAM47 is therefore inhibition of Interleukin 1 receptor-like 1 (IL1RL1, Accession NP_775661.1), a gene which is possibly involved in regulation of t- lymphocyte action. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RL1.

[5316] The function of IL1RL1 has been established by previous studies. Tominaga (1989) isolated a murine gene, which they termed St2, as one of the genes specifically expressed by growth stimulation in BALB/c- 3T3 cells. The gene encodes 2 protein products: St2, the soluble secreted form; and St2L, the transmembrane receptor form which is very similar to the interleukin- 1 receptors (147810; 147911) that map to human chromosome 2. Tominaga (1989) suggested that St2 gene expression is related to the growth of cells and that an unknown signal is transduced to control cell proliferation by binding of

specific ligand(s). Because the symbol ST2 had already been assigned to a locus on 11p (see OMIM Ref. No. 185440), the HUGO Nomenclature Committee designated the human homolog of the mouse St2 gene as IL1RL1. By use of a mouse St2 probe to screen an activated human helper T- cell line library, Tominaga et al. (1992) isolated a cDNA for IL1RL1, which encodes a 328- amino acid protein with 9 potential glycosylation sites and 3 Ig- like domains. By Northern blot analysis, Kumar et al. (1997) detected expression of a 1.4- kb IL1RL1 transcript in skeletal muscle, heart, brain, and pancreas, with additional 2.5- and 4.2- kb transcripts in lung, liver, placenta, and kidney. By RT- PCR analysis, they observed constitutive expression in mesenchymal and myeloblastic cell lines, with further induction by phorbol ester or cytokine stimulation. Expression in mouse, in contrast, occurs only between days 2 and 4 after exposure to UVB irradiation.

[5317]

[5318] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5319] Tago, K.; Noda, T.; Hayakawa, M.; Iwahana, H.; Yanagisawa, K.; Yashiro, T.; Tominaga, S. : Tissue distribution

and subcellular localization of a variant form of the human ST2 gene product, ST2V. Biochem. Biophys. Res. Commun. 285: 1377- 1383, 2001. ; and

[5320] Tominaga, S. : A putative protein of a growth specific cDNA from BALB/c- 3T3 cells is highly similar to the extracellular portion of mouse interleukin 1 receptor. FEBS Lett. 258: 301- 304.

[5321] Further studies establishing the function and utilities of IL1RL1 are found in John Hopkins OMIM database record ID 601203, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 1 receptor-like 1 (IL1RL1, Accession NP_003847.2) is another GAM47 target gene, herein designated TARGET GENE. IL1RL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL1RL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL1RL1 BINDING SITE, designated SEQ ID:1862, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5322] Another function of GAM47 is therefore inhibition of In-

terleukin 1 receptor-like 1 (IL1RL1, Accession NP_003847.2), a gene which is possibly involved in regulation of t- lymphocyte action. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RL1.

[5323] The function of IL1RL1 has been established by previous studies. Tominaga (1989) isolated a murine gene, which they termed St2, as one of the genes specifically expressed by growth stimulation in BALB/c- 3T3 cells. The gene encodes 2 protein products: St2, the soluble secreted form; and St2L, the transmembrane receptor form which is very similar to the interleukin- 1 receptors (147810; 147911) that map to human chromosome 2. Tominaga (1989) suggested that St2 gene expression is related to the growth of cells and that an unknown signal is transduced to control cell proliferation by binding of specific ligand(s). Because the symbol ST2 had already been assigned to a locus on 11p (see OMIM Ref. No. 185440), the HUGO Nomenclature Committee designated the human homolog of the mouse St2 gene as IL1RL1. By use of a mouse St2 probe to screen an activated human helper T- cell line library, Tominaga et al. (1992) isolated a cDNA for IL1RL1, which encodes a 328- amino acid pro-

tein with 9 potential glycosylation sites and 3 Ig- like domains. By Northern blot analysis, Kumar et al. (1997) detected expression of a 1.4- kb IL1RL1 transcript in skeletal muscle, heart, brain, and pancreas, with additional 2.5- and 4.2- kb transcripts in lung, liver, placenta, and kidney. By RT- PCR analysis, they observed constitutive expression in mesenchymal and myeloblastic cell lines, with further induction by phorbol ester or cytokine stimulation. Expression in mouse, in contrast, occurs only between days 2 and 4 after exposure to UVB irradiation.

[5325] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5326] Tago, K.; Noda, T.; Hayakawa, M.; Iwahana, H.; Yanagisawa, K.; Yashiro, T.; Tominaga, S. : Tissue distribution and subcellular localization of a variant form of the human ST2 gene product, ST2V. Biochem. Biophys. Res. Commun. 285: 1377- 1383, 2001. ; and

[5327] Tominaga, S. : A putative protein of a growth specific cDNA from BALB/c- 3T3 cells is highly similar to the extracellular portion of mouse interleukin 1 receptor. FEBS Lett. 258: 301- 304.

[5328] Further studies establishing the function and utilities of IL1RL1 are found in John Hopkins OMIM database record ID 601203, and in cited publications listed in Table 5, which are hereby incorporated by reference.Insulin receptor substrate 3-like (IRS3L, Accession XP_295210.1) is another GAM47 target gene, herein designated TARGET GENE. IRS3L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IRS3L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRS3L BINDING SITE, designated SEQ ID:3181, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5329] Another function of GAM47 is therefore inhibition of Insulin receptor substrate 3-like (IRS3L, Accession XP_295210.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS3L.

[5330] Integrin, alpha d (ITGAD, Accession XP_113880.1) is another GAM47 target gene, herein designated TARGET GENE. ITGAD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITGAD,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGAD BINDING SITE, designated SEQ ID:15692, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5331] Another function of GAM47 is therefore inhibition of Integrin, alpha d (ITGAD, Accession XP_113880.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAD.

[5332] Inositol 1,4,5-triphosphate receptor, type 2 (ITPR2, Accession NP_002214.1) is another GAM47 target gene, herein designated TARGET GENE. ITPR2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ITPR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:15620, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5333] Another function of GAM47 is therefore inhibition of Inos-

itol 1,4,5-triphosphate receptor, type 2 (ITPR2, Accession NP_002214.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2.

[5334] Jumonji homolog (mouse) (JMJ, Accession NP_004964.2) is another GAM47 target gene, herein designated TARGET GENE. JMJ BINDING SITE1 and JMJ BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by JMJ, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JMJ BINDING SITE1 and JMJ BINDING SITE2, designated SEQ ID:14768 and SEQ ID:14602 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5335] Another function of GAM47 is therefore inhibition of Jumonji homolog (mouse) (JMJ, Accession NP_004964.2), a gene which participates in the negative regulation of cell growth. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JMJ.

[5336] The function of JMJ has been established by previous studies. Berge- Lefranc et al. (1996) isolated clones highly

homologous to the mouse gene jumonji from a human embryonic cDNA library. In mouse, jumonji (jmj) is required for neural tube formation. Berge- Lefranc et al. (1996) reported that the human jumonji (JMJ) and mouse jmj gene products are 90% identical. Northern blot analysis revealed a low level of expression of JMJ in all human embryonic and adult tissues analyzed. In situ hybridization studies on embryonic slices revealed high levels of expression in dorsal root ganglia neurons. The authors detected high levels of expression in adult cerebral cortex. Toyoda et al. (2000) determined that JMJ is expressed as a 160- kD protein by Western blot analysis. Immunofluorescence and Western blot analysis demonstrated that JMJ specifically localizes to the cell nucleus. Overexpression of JMJ appeared to inhibit cell growth, whereas Jmj- deficient mice had cell growth enhancement. Berge- Lefranc et al. (1996) mapped the human JMJ gene to chromosome 6p24- p23 using autoradiographic in situ hybridization

[5337]

[5338] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5339] Berge- Lefranc, J.- L.; Jay, P.; Massacrier, A.; Cau, P.; Mattei, M. G.; Bauer, S.; Marsollier, C.; Berta, P.; Fontes, M. : Characterization of the human jumonji gene. Hum. Molec. Genet. 5: 1637- 1641, 1996. ; and

[5340] Toyoda, M.; Kojima, M.; Takeuchi, T. : Jumonji is a nuclear protein that participates in the negative regulation of cell growth. Biochem. Biophys. Res. Commun. 274: 332- 336, 2000.

[5341] Further studies establishing the function and utilities of JMJ are found in John Hopkins OMIM database record ID 601594, and in cited publications listed in Table 5, which are hereby incorporated by reference.JPHL1 (Accession XP_033366.1) is another GAM47 target gene, herein designated TARGET GENE. JPHL1 BINDING SITE1 and JPHL1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by JPHL1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JPHL1 BINDING SITE1 and JPHL1 BINDING SITE2, designated SEQ ID:7827 and SEQ ID:511 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5342] Another function of GAM47 is therefore inhibition of JPHL1 (Accession XP_033366.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JPHL1.

[5343] K5B (Accession NP_775487.1) is another GAM47 target gene, herein designated TARGET GENE. K5B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by K5B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of K5B BINDING SITE, designated SEQ ID:19844, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5344] Another function of GAM47 is therefore inhibition of K5B (Accession NP_775487.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with K5B.

[5345] KBF2 (Accession NP_056958.1) is another GAM47 target gene, herein designated TARGET GENE. KBF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KBF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KBF2 BINDING SITE, designated SEQ ID:16939, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5346] Another function of GAM47 is therefore inhibition of KBF2 (Accession NP_056958.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KBF2.

[5347] Potassium inwardly-rectifying channel, subfamily j, member 10 (KCNJ10, Accession NP_002232.2) is another GAM47 target gene, herein designated TARGET GENE. KCNJ10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNJ10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:13377, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5348] Another function of GAM47 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 10 (KCNJ10, Accession NP_002232.2), a gene which

may be responsible for potassium buffering action of glial cells in the brain. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10.

[5349] The function of KCNJ10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Potassium intermediate/small conductance calcium-activated channel, subfamily n, member 2 (KCNN2, Accession NP_740721.1) is another GAM47 target gene, herein designated TARGET GENE. KCNN2 BINDING SITE1 and KCNN2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by KCNN2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNN2 BINDING SITE1 and KCNN2 BINDING SITE2, designated SEQ ID:7656 and SEQ ID:17552 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5350] Another function of GAM47 is therefore inhibition of Potassium intermediate/small conductance calcium-acti-

vated channel, subfamily n, member 2 (KCNN2, Accession NP_740721.1), a gene which forms a voltage- independent potassium channel activated by intracellular calcium. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN2.

[5351] The function of KCNN2 has been established by previous studies. Calcium- activated potassium channels respond to changes in intracellular calcium concentration and couple calcium metabolism to potassium flux and membrane excitability. Based on their electrophysiologic properties, calcium- activated potassium channels are classified as large conductance, calcium- and voltage- gated channels (BK, e.g., KCNMB4; 605223), intermediate conductance, voltage- independent channels (IK, e.g., KCNN4; 602754), and small conductance, voltage- independent channels (SK, e.g., KCNN3; 602983). By screening a Jurkat T- cell cDNA library using RT- PCR with degenerate primers based on rat and human SK channels, followed by searching an EST database, Desai et al. (2000) isolated a cDNA encoding KCNN2, which they termed SK2. Sequence analysis predicted that the 579- amino acid protein, which is 97% identical to the rat sequence, contains multiple phos-

phorylation sites and no N- glycosylation sites. Northern blot analysis detected a major 2.5- kb transcript that was expressed most strongly in liver and brain, with lower levels in kidney and Jurkat (but not peripheral) T cells. A minor 4.4- kb transcript was expressed in heart and skeletal muscle, and a 1.3- kb transcript was expressed in brain and liver. Functional analysis showed that KCNN2 expresses a potassium current that is sensitive to apamin, scyllatoxin, and tubocurarine and is insensitive to charybdotoxin. Schumacher et al. (2001) determined the crystal structure of calmodulin (OMIM Ref. No. 114180) bound to KCNN2. The calmodulin- binding domain forms an elongated dimer with a calmodulin molecule bound at each end; each calmodulin wraps around 3 alpha helices, 2 from 1 calmodulin- binding domain subunit and 1 from the other.

[5352]

[5353] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5354] Desai, R.; Peretz, A.; Idelson, H.; Lazarovici, P.; Attali, B. : Ca(2+)- activated K(+) channels in human leukemic Jurkat T cells: molecular cloning, biochemical and functional

characterization. J. Biol. Chem. 275: 39954- 39963, 2000. ; and

[5355] Schumacher, M. A.; Rivard, A. F.; Bachinger, H. P.; Adelman, J. P. : Structure of the gating domain of a Ca(2+)-activated K+ channel complexed with Ca(2+)/calmodulin. Nature 410: 1120- .

[5356] Further studies establishing the function and utilities of KCNN2 are found in John Hopkins OMIM database record ID 605879, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium voltage-gated channel, kqt-like subfamily, member 2 (KCNQ2, Accession NP_004509.2) is another GAM47 target gene, herein designated TARGET GENE. KCNQ2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNQ2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNQ2 BINDING SITE, designated SEQ ID:5313, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5357] Another function of GAM47 is therefore inhibition of Potassium voltage-gated channel, kqt-like subfamily,

member 2 (KCNQ2, Accession NP_004509.2), a gene which is probably important in the regulation of neuronal excitability. and therefore is associated with Epilepsy, benign neonatal, 1. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Epilepsy, benign neonatal, 1, and of other diseases and clinical conditions associated with KCNQ2.

[5358] The function of KCNQ2 has been established by previous studies. Of 12 BFNC probands selected by Singh et al. (1998), 3 were from families that showed significant linkage, with lod scores greater than 3.0 on chromosome 20. Two mutations of the KCNQ2 gene were found in all 3 families. Two were single probands, and a splice site mutation was found in 1. The remaining 7 families were too small for linkage to chromosome 20 to be demonstrated. In this group, however, mutations in KCNQ2 were observed in 2 families. The complete KCNQ2 gene had not been screened for mutations in the 6 remaining pedigrees. In a large pedigree with BFNC, Biervert et al. (1998) found a 5- bp insertion (602235.0003) that was predicted to delete more than 300 amino acids from the C terminus of KCNQ2. Expression of the mutant channel did not yield measurable currents. Thus, impairment of potassium- de-

pendent repolarization was indicated as the cause of this age- specific epileptic syndrome. In a Caucasian family, Dedek et al. (2001) described a syndrome (OMIM Ref. No. 606437) in which benign familial neonatal convulsions (BFNC) was followed later in life by myokymia, involuntary contractions of skeletal muscles. All affected members of the family carried an arg207- to- trp (R207W) mutation (602235.0006) that neutralized a charged amino acid in the S4 voltage- sensor segment of KCNQ2. This substitution led to a shift of voltage- dependent activation of KCNQ2 and a dramatic slowing of activation upon depolarization. Myokymia was thought to result from hyperexcitability of the lower motoneuron; indeed both KCNQ2 and KCNQ3 mRNAs were detected in the anterior horn of the spinal cord where the cells of the lower motoneurons arise. Dedek et al. (2001) proposed that a difference in firing patterns between motoneurons and central neurons, combined with the drastically slowed voltage activation of the R207W mutant, explained by this particular KCNQ2 mutant caused myokymia in addition to BFNC.

[5359]

[5360] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[5361] Dedek, K.; Kunath, B.; Kananura, C.; Reuner, U.; Jentsch, T. J.; Steinlein, O. K. : Myokymia and neonatal epilepsy caused by a mutation in the voltage sensor of the KCNQ2 K(+) channel. Proc. Nat. Acad. Sci. 98: 12272- 12277, 2001. ; and

[5362] Biervert, C.; Schroeder, B. C.; Kubisch, C.; Berkovic, S. F.; Propping, P.; Jentsch, T. J.; Steinlein, O. K. : A potassium channel mutation in neonatal human epilepsy. Science 279: 406- .

[5363] Further studies establishing the function and utilities of KCNQ2 are found in John Hopkins OMIM database record ID 602235, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ketohexokinase (fructokinase) (KHK, Accession NP_000212.1) is another GAM47 target gene, herein designated TARGET GENE. KHK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KHK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KHK BINDING SITE, designated SEQ ID:14640, to the nucleotide se-

quence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5364] Another function of GAM47 is therefore inhibition of Ketohexokinase (fructokinase) (KHK, Accession NP_000212.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHK.

[5365] Ketohexokinase (fructokinase) (KHK, Accession NP_006479.1) is another GAM47 target gene, herein designated TARGET GENE. KHK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KHK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KHK BINDING SITE, designated SEQ ID:14640, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5366] Another function of GAM47 is therefore inhibition of Ketohexokinase (fructokinase) (KHK, Accession NP_006479.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHK.

[5367] KIAA0040 (Accession NP_055471.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0040 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0040, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:9372, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5368] Another function of GAM47 is therefore inhibition of KIAA0040 (Accession NP_055471.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040.

[5369] KIAA0125 (Accession NP_055607.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0125 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE, designated SEQ ID:11734, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5370] Another function of GAM47 is therefore inhibition of KIAA0125 (Accession NP_055607.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125.

[5371] KIAA0140 (Accession NP_055476.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0140 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0140 BINDING SITE, designated SEQ ID:19181, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5372] Another function of GAM47 is therefore inhibition of KIAA0140 (Accession NP_055476.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0140.

[5373] KIAA0152 (Accession NP_055545.1) is another GAM47

target gene, herein designated TARGET GENE. KIAA0152 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0152, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:15014, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5374] Another function of GAM47 is therefore inhibition of KIAA0152 (Accession NP_055545.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152.

[5375] KIAA0247 (Accession NP_055549.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0247 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0247, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:11188, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[5376] Another function of GAM47 is therefore inhibition of KIAA0247 (Accession NP_055549.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247.

[5377] KIAA0265 (Accession XP_045954.2) is another GAM47 target gene, herein designated TARGET GENE. KIAA0265 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0265, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:19568, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5378] Another function of GAM47 is therefore inhibition of KIAA0265 (Accession XP_045954.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265.

[5379] KIAA0342 (Accession XP_047357.3) is another GAM47 target gene, herein designated TARGET GENE. KIAA0342

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0342, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0342 BINDING SITE, designated SEQ ID:9739, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5380] Another function of GAM47 is therefore inhibition of KIAA0342 (Accession XP_047357.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0342.

[5381] KIAA0453 (Accession XP_044546.3) is another GAM47 target gene, herein designated TARGET GENE. KIAA0453 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0453, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0453 BINDING SITE, designated SEQ ID:9509, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5382] Another function of GAM47 is therefore inhibition of KIAA0453 (Accession XP_044546.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0453.

[5383] KIAA0455 (Accession NP_055654.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0455 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0455, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0455 BINDING SITE, designated SEQ ID:8206, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5384] Another function of GAM47 is therefore inhibition of KIAA0455 (Accession NP_055654.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0455.

[5385] KIAA0455 (Accession XP_051785.3) is another GAM47 target gene, herein designated TARGET GENE. KIAA0455 BINDING SITE is a target binding site found in the 3` un-

translated region of multiple transcripts of mRNA encoded by KIAA0455, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0455 BINDING SITE, designated SEQ ID:8206, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5386] Another function of GAM47 is therefore inhibition of KIAA0455 (Accession XP_051785.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0455.

[5387] KIAA0471 (Accession NP_055672.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0471 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0471, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:15061, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5388] Another function of GAM47 is therefore inhibition of

KIAA0471 (Accession NP_055672.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471.

[5389] KIAA0472 (Accession XP_290898.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0472 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0472, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:18719, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5390] Another function of GAM47 is therefore inhibition of KIAA0472 (Accession XP_290898.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472.

[5391] KIAA0532 (Accession XP_047659.6) is another GAM47 target gene, herein designated TARGET GENE. KIAA0532 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0532, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0532 BINDING SITE, designated SEQ ID:5472, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5392] Another function of GAM47 is therefore inhibition of KIAA0532 (Accession XP_047659.6) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0532.

[5393] KIAA0570 (Accession XP_291018.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0570 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0570, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0570 BINDING SITE, designated SEQ ID:4468, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5394] Another function of GAM47 is therefore inhibition of KIAA0570 (Accession XP_291018.1) . Accordingly, utilities

of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0570.

[5395] KIAA0605 (Accession NP_055509.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0605 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0605, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0605 BINDING SITE, designated SEQ ID:19802, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5396] Another function of GAM47 is therefore inhibition of KIAA0605 (Accession NP_055509.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0605.

[5397] KIAA0721 (Accession NP_067680.2) is another GAM47 target gene, herein designated TARGET GENE. KIAA0721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0721, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0721 BINDING SITE, designated SEQ ID:5642, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5398] Another function of GAM47 is therefore inhibition of KIAA0721 (Accession NP_067680.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721.

[5399] KIAA0790 (Accession NP_056093.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0790 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0790, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0790 BINDING SITE, designated SEQ ID:12202, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5400] Another function of GAM47 is therefore inhibition of KIAA0790 (Accession NP_056093.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0790.

[5401] KIAA0795 (Accession NP_079286.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0795 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0795, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:6957, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5402] Another function of GAM47 is therefore inhibition of KIAA0795 (Accession NP_079286.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795.

[5403] KIAA0841 (Accession XP_049237.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:11413, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5404] Another function of GAM47 is therefore inhibition of KIAA0841 (Accession XP_049237.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841.

[5405] KIAA0843 (Accession NP_055760.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0843 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0843, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0843 BINDING SITE, designated SEQ ID:5395, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5406] Another function of GAM47 is therefore inhibition of KIAA0843 (Accession NP_055760.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0843.

[5407] KIAA0889 (Accession NP_056192.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0889 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:4048, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5408] Another function of GAM47 is therefore inhibition of KIAA0889 (Accession NP_056192.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889.

[5409] KIAA0889 (Accession NP_689470.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA0889 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:4048, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5410] Another function of GAM47 is therefore inhibition of KIAA0889 (Accession NP_689470.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889.

[5411] KIAA1076 (Accession XP_037523.6) is another GAM47 target gene, herein designated TARGET GENE. KIAA1076 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1076, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1076 BINDING SITE, designated SEQ ID:6169, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5412] Another function of GAM47 is therefore inhibition of KIAA1076 (Accession XP_037523.6) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1076.

[5413] KIAA1145 (Accession NP_065749.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1145 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1145, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1145 BINDING SITE, designated SEQ ID:14401, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5414] Another function of GAM47 is therefore inhibition of KIAA1145 (Accession NP_065749.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1145.

[5415] KIAA1155 (Accession XP_030864.2) is another GAM47 target gene, herein designated TARGET GENE. KIAA1155 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1155, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:17447, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5416] Another function of GAM47 is therefore inhibition of KIAA1155 (Accession XP_030864.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155.

[5417] KIAA1157 (Accession XP_051093.2) is another GAM47 target gene, herein designated TARGET GENE. KIAA1157 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1157, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:715, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5418] Another function of GAM47 is therefore inhibition of KIAA1157 (Accession XP_051093.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157.

[5419] KIAA1198 (Accession NP_065765.1) is another GAM47

target gene, herein designated TARGET GENE. KIAA1198 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:11270, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5420] Another function of GAM47 is therefore inhibition of KIAA1198 (Accession NP_065765.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198.

[5421] KIAA1257 (Accession XP_031577.2) is another GAM47 target gene, herein designated TARGET GENE. KIAA1257 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:5577, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[5422] Another function of GAM47 is therefore inhibition of KIAA1257 (Accession XP_031577.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257.

[5423] KIAA1474 (Accession NP_065907.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1474 BINDING SITE, designated SEQ ID:13050, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5424] Another function of GAM47 is therefore inhibition of KIAA1474 (Accession NP_065907.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1474.

[5425] KIAA1511 (Accession XP_046581.5) is another GAM47 target gene, herein designated TARGET GENE. KIAA1511

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1511, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1511 BINDING SITE, designated SEQ ID:15469, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5426] Another function of GAM47 is therefore inhibition of KIAA1511 (Accession XP_046581.5) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1511.

[5427] KIAA1579 (Accession NP_060681.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1579 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1579, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1579 BINDING SITE, designated SEQ ID:2423, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5428] Another function of GAM47 is therefore inhibition of KIAA1579 (Accession NP_060681.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1579.

[5429] KIAA1596 (Accession XP_048128.4) is another GAM47 target gene, herein designated TARGET GENE. KIAA1596 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1596, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1596 BINDING SITE, designated SEQ ID:16420, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5430] Another function of GAM47 is therefore inhibition of KIAA1596 (Accession XP_048128.4) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1596.

[5431] KIAA1691 (Accession XP_166523.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1691 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1691, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:8926, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5432] Another function of GAM47 is therefore inhibition of KIAA1691 (Accession XP_166523.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691.

[5433] KIAA1735 (Accession XP_290496.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1735 BINDING SITE1 and KIAA1735 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1735, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1735 BINDING SITE1 and KIAA1735 BINDING SITE2, designated SEQ ID:11569 and SEQ ID:15572 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated

SEQ ID:269.

[5434] Another function of GAM47 is therefore inhibition of KIAA1735 (Accession XP_290496.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1735.

[5435] KIAA1750 (Accession NP_277047.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1750 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1750, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:15393, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5436] Another function of GAM47 is therefore inhibition of KIAA1750 (Accession NP_277047.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750.

[5437] KIAA1754 (Accession NP_203755.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1754

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1754, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1754 BINDING SITE, designated SEQ ID:18714, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5438] Another function of GAM47 is therefore inhibition of KIAA1754 (Accession NP_203755.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1754.

[5439] KIAA1827 (Accession XP_290834.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1827 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1827, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1827 BINDING SITE, designated SEQ ID:8005, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5440] Another function of GAM47 is therefore inhibition of KIAA1827 (Accession XP_290834.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1827.

[5441] KIAA1847 (Accession NP_852149.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1847 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA1847, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1847 BINDING SITE, designated SEQ ID:9906, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5442] Another function of GAM47 is therefore inhibition of KIAA1847 (Accession NP_852149.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1847.

[5443] KIAA1854 (Accession XP_049884.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1854 BINDING SITE1 and KIAA1854 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by KIAA1854, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE1 and KIAA1854 BINDING SITE2, designated SEQ ID:9110 and SEQ ID:16614 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5444] Another function of GAM47 is therefore inhibition of KIAA1854 (Accession XP_049884.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854.

[5445] KIAA1904 (Accession XP_056282.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1904 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1904, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:1062, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[5446] Another function of GAM47 is therefore inhibition of KIAA1904 (Accession XP_056282.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904.

[5447] KIAA1908 (Accession XP_055834.1) is another GAM47 target gene, herein designated TARGET GENE. KIAA1908 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1908, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:4011, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5448] Another function of GAM47 is therefore inhibition of KIAA1908 (Accession XP_055834.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908.

[5449] KIAA1977 (Accession XP_058800.3) is another GAM47 target gene, herein designated TARGET GENE. KIAA1977

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1977, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1977 BINDING SITE, designated SEQ ID:1151, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5450] Another function of GAM47 is therefore inhibition of KIAA1977 (Accession XP_058800.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1977.

[5451] KIF12 (Accession NP_612433.1) is another GAM47 target gene, herein designated TARGET GENE. KIF12 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF12 BINDING SITE, designated SEQ ID:13316, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5452] Another function of GAM47 is therefore inhibition of KIF12 (Accession NP_612433.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF12.

[5453] Kinesin family member 5a (KIF5A, Accession NP_004975.1) is another GAM47 target gene, herein designated TARGET GENE. KIF5A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIF5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF5A BINDING SITE, designated SEQ ID:12319, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5454] Another function of GAM47 is therefore inhibition of Kinesin family member 5a (KIF5A, Accession NP_004975.1), a gene which is a microtubule- associated force- producing protein that may play a role in organelle transport. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5A.

[5455] The function of KIF5A has been established by previous studies. By screening a human hippocampal cDNA library

with a fragment of a human kinesin heavy chain (KHC) expressed sequence tag clone, Niclas et al. (1994) isolated cDNAs encoding NKHC. The predicted 1,032- amino acid protein has the characteristic features of a KHC, as well as a unique C- terminal stretch of 69 amino acids. The amino acid sequence of NKHC is 65% and 54% identical to the amino acid sequences of KNS1 and the Drosophila KHC, respectively. Northern blot analysis of rat tissues detected Nkhc expression only in brain, where multiple transcripts were found. Immunoblot analysis of rat tissue extracts using antibodies specific for NKHC detected a doublet of approximately 120 and 133 kD only in brain and sciatic nerve tissue. By indirect immunofluorescence, the authors showed that NKHC is distributed throughout the central nervous system but is highly enriched in subsets of neurons. Within cultured hippocampal neurons, NKHC is concentrated in the cell body, particularly in the perinuclear region. By FISH, Hamlin et al. (1998) mapped the KIF5A and GALGT (OMIM Ref. No. 601873) genes to 12q13. They found that these genes are contained within the same approximately 200- kb YAC insert as the GLI (OMIM Ref. No. 165220) and DDIT3 (OMIM Ref. No. 126337) genes.

[5456]

[5457] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5458] Hamlin, P. J.; Jones, P. F.; Leek, J. P.; Bransfield, K.; Lench, N. J.; Aldersley, M. A.; Howdle, P. D.; Markham, A. F.; Robinson, P. A. : Assignment of GALGT encoding beta-1,4N- acetylgalactosaminyl- transferase (GalNAc- T) and KIF5A encoding neuronal kinesin (D12S1889) to human chromosome band 12q13 by assignment to ICI YAC 26EG10 and in situ hybridization. Cytogenet. Cell Genet. 82: 267- 268, 1998. ; and

[5459] Niclas, J.; Navone, F.; Hom- Booher, N.; Vale, R. D. : Cloning and localization of a conventional kinesin motor expressed exclusively in neurons. Neuron 12: 1059-1072, 1994.

[5460] Further studies establishing the function and utilities of KIF5A are found in John Hopkins OMIM database record ID 602821, and in cited publications listed in Table 5, which are hereby incorporated by reference.Karyopherin alpha 4 (importin alpha 3) (KPNA4, Accession NP_002259.1) is an-other GAM47 target gene, herein designated TARGET GENE. KPNA4 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by KPNA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNA4 BINDING SITE, designated SEQ ID:18627, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5461] Another function of GAM47 is therefore inhibition of Karyopherin alpha 4 (importin alpha 3) (KPNA4, Accession NP_002259.1), a gene which promotes docking of import substrates to the nuclear pore complex. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA4.

[5462] The function of KPNA4 has been established by previous studies. The nuclear import of karyophilic proteins is directed by short amino acid sequences termed nuclear localization signals (NLSs). Karyopherins, or importins, are cytoplasmic proteins that recognize NLSs and dock NLS-containing proteins to the nuclear pore complex. See KPNA2 (OMIM Ref. No. 600685). Using a yeast 2- hybrid system to identify proteins that interact with the DNA helicase Q1 (RECQL; 600537), Seki et al. (1997) isolated

HeLa cell cDNAs encoding QIP1. The predicted 521- amino acid QIP1 protein contains the conserved N- terminal binding site for karyopherin- beta (see OMIM Ref. No. KPNB1; 602738) and a series of 7 degenerate 'armadillo' repeats, which are 42- amino acid motifs implicated in protein- protein interactions. Human QIP1 has 50% amino acid identity with human KPNA2, 49% with Xenopus importin- alpha, 47% with human KPNA1 (OMIM Ref. No. 600686), and 46% with S. cerevisiae Srp1. The authors demonstrated that QIP1 interacted with the NLSs of DNA helicase Q1 and SV40 T antigen. Kohler et al. (1997) isolated a human KPNA4 cDNA. The predicted KPNA4 protein contains an N- terminal importin- beta- binding (IBB) domain, 8 armadillo repeats, and a C- terminal acidic region, all of which are characteristics of importin- alphas. Of the known human importin- alphas, KPNA4 shares the highest sequence identity with KPNA3 (OMIM Ref. No. 601892). Northern blot analysis detected a 4.4- kb KPNA4 transcript in all tissues tested. However, expression levels varied considerably among tissues, with the highest expression in testis, ovary, small intestine, and pancreas, and the lowest expression in kidney, thymus, colon, and peripheral blood leukocytes.

[5463]

[5464] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5465] Ayala- Madrigal, M. L.; Doerr, S.; Ramirez- Duenas, M. L.; Hansmann, I. : Assignment of KPNA4 and KPNB1 encoding karyopherin alpha 4 and beta 1 to human chromosome bands 11q22 and 17q21 respectively, by in situ hybridization. Cytogenet. Cell Genet. 89: 258- 259, 2000. ; and

[5466] Kohler, M.; Ansieau, S.; Prehn, S.; Leutz, A.; Haller, H.; Hartmann, E. : Cloning of two novel human importin- alpha subunits and analysis of the expression pattern of the importin- alpha.

[5467] Further studies establishing the function and utilities of KPNA4 are found in John Hopkins OMIM database record ID 602970, and in cited publications listed in Table 5, which are hereby incorporated by reference.KSP37 (Accession NP_114156.1) is another GAM47 target gene, herein designated TARGET GENE. KSP37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KSP37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KSP37 BINDING SITE, designated SEQ ID:11509, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5468] Another function of GAM47 is therefore inhibition of KSP37 (Accession NP_114156.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KSP37.

[5469] LENG8 (Accession NP_443157.1) is another GAM47 target gene, herein designated TARGET GENE. LENG8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LENG8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LENG8 BINDING SITE, designated SEQ ID:5511, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5470] Another function of GAM47 is therefore inhibition of LENG8 (Accession NP_443157.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG8.

[5471] LEP5 (Accession NP_848130.1) is another GAM47 target gene, herein designated TARGET GENE. LEP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LEP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LEP5 BINDING SITE, designated SEQ ID:598, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5472] Another function of GAM47 is therefore inhibition of LEP5 (Accession NP_848130.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP5.

[5473] Leucine-rich repeat lgi family, member 3 (LGI3, Accession NP_644807.1) is another GAM47 target gene, herein designated TARGET GENE. LGI3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LGI3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGI3 BINDING SITE, designated SEQ ID:11001, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[5474] Another function of GAM47 is therefore inhibition of Leucine-rich repeat lgi family, member 3 (LGI3, Accession NP_644807.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI3.

[5475] Lim homeobox protein 1 (LHX1, Accession NP_005559.2) is another GAM47 target gene, herein designated TARGET GENE. LHX1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LHX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LHX1 BINDING SITE, designated SEQ ID:2371, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5476] Another function of GAM47 is therefore inhibition of Lim homeobox protein 1 (LHX1, Accession NP_005559.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX1.

[5477] Leukemia inhibitory factor (cholinergic differentiation factor) (LIF, Accession NP_002300.1) is another GAM47 tar-

get gene, herein designated TARGET GENE. LIF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:3616, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5478] Another function of GAM47 is therefore inhibition of Leukemia inhibitory factor (cholinergic differentiation factor) (LIF, Accession NP_002300.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF.

[5479] Lipase, endothelial (LIPG, Accession NP_006024.1) is another GAM47 target gene, herein designated TARGET GENE. LIPG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LIPG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIPG BINDING SITE, designated SEQ ID:19350, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5480] Another function of GAM47 is therefore inhibition of Lipase, endothelial (LIPG, Accession NP_006024.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPG.

[5481] LITAF (Accession NP_004853.1) is another GAM47 target gene, herein designated TARGET GENE. LITAF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LITAF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LITAF BINDING SITE, designated SEQ ID:18731, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5482] Another function of GAM47 is therefore inhibition of LITAF (Accession NP_004853.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LITAF.

[5483] LNIR (Accession NP_112178.1) is another GAM47 target gene, herein designated TARGET GENE. LNIR BINDING SITE is a target binding site found in the 5` untranslated re-

gion of mRNA encoded by LNIR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LNIR BINDING SITE, designated SEQ ID:9127, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5484] Another function of GAM47 is therefore inhibition of LNIR (Accession NP_112178.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNIR.

[5485] LOC113612 (Accession XP_054492.1) is another GAM47 target gene, herein designated TARGET GENE. LOC113612 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC113612, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC113612 BINDING SITE, designated SEQ ID:7603, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5486] Another function of GAM47 is therefore inhibition of LOC113612 (Accession XP_054492.1) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113612.

[5487] LOC122282 (Accession XP_063046.4) is another GAM47 target gene, herein designated TARGET GENE. LOC122282 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC122282, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC122282 BINDING SITE, designated SEQ ID:18448, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5488] Another function of GAM47 is therefore inhibition of LOC122282 (Accession XP_063046.4) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122282.

[5489] LOC122553 (Accession NP_803235.1) is another GAM47 target gene, herein designated TARGET GENE. LOC122553 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC122553, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:4360, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5490] Another function of GAM47 is therefore inhibition of LOC122553 (Accession NP_803235.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553.

[5491] LOC124751 (Accession XP_064298.4) is another GAM47 target gene, herein designated TARGET GENE. LOC124751 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC124751, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124751 BINDING SITE, designated SEQ ID:9596, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5492] Another function of GAM47 is therefore inhibition of LOC124751 (Accession XP_064298.4) . Accordingly, utilities of GAM47 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC124751.

[5493] LOC124976 (Accession XP_058879.5) is another GAM47 target gene, herein designated TARGET GENE. LOC124976 BINDING SITE1 and LOC124976 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC124976, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124976 BINDING SITE1 and LOC124976 BINDING SITE2, designated SEQ ID:16219 and SEQ ID:8653 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5494] Another function of GAM47 is therefore inhibition of LOC124976 (Accession XP_058879.5) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124976.

[5495] LOC128954 (Accession XP_066252.3) is another GAM47 target gene, herein designated TARGET GENE. LOC128954 BINDING SITE1 through LOC128954 BINDING SITE3 are target binding sites found in untranslated regions of

mRNA encoded by LOC128954, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC128954 BINDING SITE1 through LOC128954 BINDING SITE3, designated SEQ ID:8782, SEQ ID:2506 and SEQ ID:8041 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5496] Another function of GAM47 is therefore inhibition of LOC128954 (Accession XP_066252.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128954.

[5497] LOC130888 (Accession NP_777559.2) is another GAM47 target gene, herein designated TARGET GENE. LOC130888 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130888, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130888 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5498] Another function of GAM47 is therefore inhibition of LOC130888 (Accession NP_777559.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130888.

[5499] LOC136345 (Accession XP_072455.2) is another GAM47 target gene, herein designated TARGET GENE. LOC136345 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC136345, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC136345 BINDING SITE, designated SEQ ID:11849, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5500] Another function of GAM47 is therefore inhibition of LOC136345 (Accession XP_072455.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136345.

[5501] LOC138307 (Accession NP_848564.1) is another GAM47 target gene, herein designated TARGET GENE. LOC138307 BINDING SITE is a target binding site found in the 3` un-

translated region of multiple transcripts of mRNA encoded by LOC138307, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC138307 BINDING SITE, designated SEQ ID:7694, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5502] Another function of GAM47 is therefore inhibition of LOC138307 (Accession NP_848564.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138307.

[5503] LOC143425 (Accession NP_783860.1) is another GAM47 target gene, herein designated TARGET GENE. LOC143425 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC143425, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:5310, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5504] Another function of GAM47 is therefore inhibition of LOC143425 (Accession NP_783860.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425.

[5505] LOC143677 (Accession XP_096471.1) is another GAM47 target gene, herein designated TARGET GENE. LOC143677 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC143677, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143677 BINDING SITE, designated SEQ ID:16903, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5506] Another function of GAM47 is therefore inhibition of LOC143677 (Accession XP_096471.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143677.

[5507] LOC144481 (Accession XP_096611.2) is another GAM47 target gene, herein designated TARGET GENE. LOC144481 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC144481, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144481 BINDING SITE, designated SEQ ID:7641, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5508] Another function of GAM47 is therefore inhibition of LOC144481 (Accession XP_096611.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144481.

[5509] LOC144766 (Accession XP_084963.2) is another GAM47 target gene, herein designated TARGET GENE. LOC144766 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144766, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144766 BINDING SITE, designated SEQ ID:17282, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5510] Another function of GAM47 is therefore inhibition of

LOC144766 (Accession XP_084963.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144766.

[5511] LOC144845 (Accession NP_612483.1) is another GAM47 target gene, herein designated TARGET GENE. LOC144845 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144845, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144845 BINDING SITE, designated SEQ ID:4355, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5512] Another function of GAM47 is therefore inhibition of LOC144845 (Accession NP_612483.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144845.

[5513] LOC144874 (Accession XP_096696.1) is another GAM47 target gene, herein designated TARGET GENE. LOC144874 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144874, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144874 BINDING SITE, designated SEQ ID:8101, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5514] Another function of GAM47 is therefore inhibition of LOC144874 (Accession XP_096696.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144874.

[5515] LOC145125 (Accession XP_085025.1) is another GAM47 target gene, herein designated TARGET GENE. LOC145125 BINDING SITE1 and LOC145125 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC145125, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145125 BINDING SITE1 and LOC145125 BINDING SITE2, designated SEQ ID:3438 and SEQ ID:18124 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5516] Another function of GAM47 is therefore inhibition of LOC145125 (Accession XP_085025.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145125.

[5517] LOC145678 (Accession XP_096832.1) is another GAM47 target gene, herein designated TARGET GENE. LOC145678 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145678, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145678 BINDING SITE, designated SEQ ID:11711, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5518] Another function of GAM47 is therefore inhibition of LOC145678 (Accession XP_096832.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145678.

[5519] LOC145814 (Accession XP_085243.1) is another GAM47 target gene, herein designated TARGET GENE. LOC145814 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC145814, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145814 BINDING SITE, designated SEQ ID:11784, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5520] Another function of GAM47 is therefore inhibition of LOC145814 (Accession XP_085243.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145814.

[5521] LOC146756 (Accession XP_097085.5) is another GAM47 target gene, herein designated TARGET GENE. LOC146756 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146756, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146756 BINDING SITE, designated SEQ ID:2465, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5522] Another function of GAM47 is therefore inhibition of

LOC146756 (Accession XP_097085.5) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756.

[5523] LOC147515 (Accession XP_097243.1) is another GAM47 target gene, herein designated TARGET GENE. LOC147515 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147515, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147515 BINDING SITE, designated SEQ ID:7233, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5524] Another function of GAM47 is therefore inhibition of LOC147515 (Accession XP_097243.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147515.

[5525] LOC148490 (Accession XP_086210.2) is another GAM47 target gene, herein designated TARGET GENE. LOC148490 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148490, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148490 BINDING SITE, designated SEQ ID:16652, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5526] Another function of GAM47 is therefore inhibition of LOC148490 (Accession XP_086210.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148490.

[5527] LOC148760 (Accession XP_097514.1) is another GAM47 target gene, herein designated TARGET GENE. LOC148760 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148760, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148760 BINDING SITE, designated SEQ ID:14757, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5528] Another function of GAM47 is therefore inhibition of LOC148760 (Accession XP_097514.1) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148760.

[5529] LOC148987 (Accession XP_086385.2) is another GAM47 target gene, herein designated TARGET GENE. LOC148987 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148987 BINDING SITE, designated SEQ ID:17867, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5530] Another function of GAM47 is therefore inhibition of LOC148987 (Accession XP_086385.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148987.

[5531] LOC149086 (Accession XP_097580.2) is another GAM47 target gene, herein designated TARGET GENE. LOC149086 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149086, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149086 BINDING SITE, designated SEQ ID:18240, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5532] Another function of GAM47 is therefore inhibition of LOC149086 (Accession XP_097580.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149086.

[5533] LOC149182 (Accession XP_097605.1) is another GAM47 target gene, herein designated TARGET GENE. LOC149182 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149182 BINDING SITE, designated SEQ ID:4614, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5534] Another function of GAM47 is therefore inhibition of LOC149182 (Accession XP_097605.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149182.

[5535] LOC149837 (Accession XP_097747.1) is another GAM47 target gene, herein designated TARGET GENE. LOC149837 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:967, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5536] Another function of GAM47 is therefore inhibition of LOC149837 (Accession XP_097747.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837.

[5537] LOC150166 (Accession XP_097824.1) is another GAM47 target gene, herein designated TARGET GENE. LOC150166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC150166 BINDING SITE, designated SEQ ID:2818, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5538] Another function of GAM47 is therefore inhibition of LOC150166 (Accession XP_097824.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150166.

[5539] LOC150933 (Accession XP_097971.1) is another GAM47 target gene, herein designated TARGET GENE. LOC150933 BINDING SITE1 and LOC150933 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC150933, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150933 BINDING SITE1 and LOC150933 BINDING SITE2, designated SEQ ID:17336 and SEQ ID:19544 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5540] Another function of GAM47 is therefore inhibition of LOC150933 (Accession XP_097971.1) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150933.

[5541] LOC150946 (Accession XP_097977.2) is another GAM47 target gene, herein designated TARGET GENE. LOC150946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150946 BINDING SITE, designated SEQ ID:6510, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5542] Another function of GAM47 is therefore inhibition of LOC150946 (Accession XP_097977.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150946.

[5543] LOC151512 (Accession XP_098072.2) is another GAM47 target gene, herein designated TARGET GENE. LOC151512 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151512, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151512 BINDING SITE, designated SEQ ID:17844, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5544] Another function of GAM47 is therefore inhibition of LOC151512 (Accession XP_098072.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151512.

[5545] LOC153364 (Accession XP_087657.1) is another GAM47 target gene, herein designated TARGET GENE. LOC153364 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153364, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153364 BINDING SITE, designated SEQ ID:15715, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5546] Another function of GAM47 is therefore inhibition of LOC153364 (Accession XP_087657.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153364.

[5547] LOC153442 (Accession XP_098373.1) is another GAM47 target gene, herein designated TARGET GENE. LOC153442 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153442 BINDING SITE, designated SEQ ID:11271, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5548] Another function of GAM47 is therefore inhibition of LOC153442 (Accession XP_098373.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153442.

[5549] LOC154822 (Accession XP_098618.3) is another GAM47 target gene, herein designated TARGET GENE. LOC154822 BINDING SITE1 and LOC154822 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC154822, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154822 BINDING SITE1 and LOC154822 BINDING SITE2, designated SEQ ID:6200 and SEQ ID:14022 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5550] Another function of GAM47 is therefore inhibition of LOC154822 (Accession XP_098618.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154822.

[5551] LOC154990 (Accession XP_088109.3) is another GAM47 target gene, herein designated TARGET GENE. LOC154990 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC154990, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154990 BINDING SITE, designated SEQ ID:18568, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5552] Another function of GAM47 is therefore inhibition of LOC154990 (Accession XP_088109.3) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154990.

[5553] LOC155006 (Accession XP_088117.1) is another GAM47 target gene, herein designated TARGET GENE. LOC155006 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC155006, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155006 BINDING SITE, designated SEQ ID:7762, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5554] Another function of GAM47 is therefore inhibition of LOC155006 (Accession XP_088117.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155006.

[5555] LOC155032 (Accession XP_098647.1) is another GAM47 target gene, herein designated TARGET GENE. LOC155032 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC155032, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155032 BINDING SITE, designated SEQ ID:11849, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5556] Another function of GAM47 is therefore inhibition of LOC155032 (Accession XP_098647.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155032.

[5557] LOC155036 (Accession XP_098651.1) is another GAM47 target gene, herein designated TARGET GENE. LOC155036 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC155036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155036 BINDING SITE, designated SEQ ID:5512, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5558] Another function of GAM47 is therefore inhibition of LOC155036 (Accession XP_098651.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC155036.

[5559] LOC157381 (Accession XP_098754.5) is another GAM47 target gene, herein designated TARGET GENE. LOC157381 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157381, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157381 BINDING SITE, designated SEQ ID:19137, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5560] Another function of GAM47 is therefore inhibition of LOC157381 (Accession XP_098754.5) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157381.

[5561] LOC157421 (Accession XP_098756.1) is another GAM47 target gene, herein designated TARGET GENE. LOC157421 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157421, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC157421 BINDING SITE, designated SEQ ID:2791, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5562] Another function of GAM47 is therefore inhibition of LOC157421 (Accession XP_098756.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157421.

[5563] LOC157784 (Accession XP_088391.4) is another GAM47 target gene, herein designated TARGET GENE. LOC157784 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157784 BINDING SITE, designated SEQ ID:15243, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5564] Another function of GAM47 is therefore inhibition of LOC157784 (Accession XP_088391.4) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157784.

[5565] LOC158527 (Accession XP_088594.1) is another GAM47 target gene, herein designated TARGET GENE. LOC158527 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158527, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158527 BINDING SITE, designated SEQ ID:8854, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5566] Another function of GAM47 is therefore inhibition of LOC158527 (Accession XP_088594.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158527.

[5567] LOC158563 (Accession XP_088606.1) is another GAM47 target gene, herein designated TARGET GENE. LOC158563 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158563, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC158563 BINDING SITE, designated SEQ ID:13743, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5568] Another function of GAM47 is therefore inhibition of LOC158563 (Accession XP_088606.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563.

[5569] LOC158997 (Accession XP_088736.1) is another GAM47 target gene, herein designated TARGET GENE. LOC158997 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158997, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158997 BINDING SITE, designated SEQ ID:4356, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5570] Another function of GAM47 is therefore inhibition of LOC158997 (Accession XP_088736.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158997.

[5571] LOC166449 (Accession XP_093876.5) is another GAM47 target gene, herein designated TARGET GENE. LOC166449 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC166449, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC166449 BINDING SITE, designated SEQ ID:18985, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5572] Another function of GAM47 is therefore inhibition of LOC166449 (Accession XP_093876.5) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166449.

[5573] LOC196415 (Accession XP_116917.2) is another GAM47 target gene, herein designated TARGET GENE. LOC196415 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196415, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196415 BINDING SITE, designated SEQ ID:7300, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5574] Another function of GAM47 is therefore inhibition of LOC196415 (Accession XP_116917.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196415.

[5575] LOC196996 (Accession XP_113796.1) is another GAM47 target gene, herein designated TARGET GENE. LOC196996 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196996, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196996 BINDING SITE, designated SEQ ID:16202, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5576] Another function of GAM47 is therefore inhibition of LOC196996 (Accession XP_113796.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196996.

[5577] LOC197379 (Accession XP_117029.1) is another GAM47

target gene, herein designated TARGET GENE. LOC197379 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC197379, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197379 BINDING SITE, designated SEQ ID:7381, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5578] Another function of GAM47 is therefore inhibition of LOC197379 (Accession XP_117029.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197379.

[5579] LOC200008 (Accession XP_114089.3) is another GAM47 target gene, herein designated TARGET GENE. LOC200008 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200008, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200008 BINDING SITE, designated SEQ ID:8828, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5580] Another function of GAM47 is therefore inhibition of LOC200008 (Accession XP_114089.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200008.

[5581] LOC200609 (Accession XP_117256.1) is another GAM47 target gene, herein designated TARGET GENE. LOC200609 BINDING SITE1 and LOC200609 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC200609, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE1 and LOC200609 BINDING SITE2, designated SEQ ID:14180 and SEQ ID:2866 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5582] Another function of GAM47 is therefore inhibition of LOC200609 (Accession XP_117256.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609.

[5583] LOC201952 (Accession XP_117345.1) is another GAM47 target gene, herein designated TARGET GENE. LOC201952 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC201952, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201952 BINDING SITE, designated SEQ ID:16641, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5584] Another function of GAM47 is therefore inhibition of LOC201952 (Accession XP_117345.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201952.

[5585] LOC202134 (Accession XP_117365.1) is another GAM47 target gene, herein designated TARGET GENE. LOC202134 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC202134, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC202134 BINDING SITE, designated SEQ ID:18733, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5586] Another function of GAM47 is therefore inhibition of LOC202134 (Accession XP_117365.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202134.

[5587] LOC219914 (Accession XP_167788.1) is another GAM47 target gene, herein designated TARGET GENE. LOC219914 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219914, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219914 BINDING SITE, designated SEQ ID:7987, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5588] Another function of GAM47 is therefore inhibition of LOC219914 (Accession XP_167788.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219914.

[5589] LOC220980 (Accession XP_167629.1) is another GAM47

target gene, herein designated TARGET GENE. LOC220980 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220980, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:10560, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5590] Another function of GAM47 is therefore inhibition of LOC220980 (Accession XP_167629.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220980.

[5591] LOC221509 (Accession XP_166477.2) is another GAM47 target gene, herein designated TARGET GENE. LOC221509 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221509, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221509 BINDING SITE, designated SEQ ID:15414, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5592] Another function of GAM47 is therefore inhibition of LOC221509 (Accession XP_166477.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221509.

[5593] LOC221663 (Accession XP_168131.1) is another GAM47 target gene, herein designated TARGET GENE. LOC221663 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221663 BINDING SITE, designated SEQ ID:7560, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5594] Another function of GAM47 is therefore inhibition of LOC221663 (Accession XP_168131.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221663.

[5595] LOC221683 (Accession XP_168089.1) is another GAM47 target gene, herein designated TARGET GENE. LOC221683

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221683, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221683 BINDING SITE, designated SEQ ID:493, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5596] Another function of GAM47 is therefore inhibition of LOC221683 (Accession XP_168089.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221683.

[5597] LOC221889 (Accession XP_166513.1) is another GAM47 target gene, herein designated TARGET GENE. LOC221889 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221889 BINDING SITE, designated SEQ ID:9970, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5598] Another function of GAM47 is therefore inhibition of LOC221889 (Accession XP_166513.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221889.

[5599] LOC221929 (Accession XP_166553.1) is another GAM47 target gene, herein designated TARGET GENE. LOC221929 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221929, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221929 BINDING SITE, designated SEQ ID:5808, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5600] Another function of GAM47 is therefore inhibition of LOC221929 (Accession XP_166553.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221929.

[5601] LOC221964 (Accession XP_168342.1) is another GAM47 target gene, herein designated TARGET GENE. LOC221964 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC221964, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221964 BINDING SITE, designated SEQ ID:14006, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5602] Another function of GAM47 is therefore inhibition of LOC221964 (Accession XP_168342.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221964.

[5603] LOC253221 (Accession XP_173010.1) is another GAM47 target gene, herein designated TARGET GENE. LOC253221 BINDING SITE1 and LOC253221 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC253221, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253221 BINDING SITE1 and LOC253221 BINDING SITE2, designated SEQ ID:18027 and SEQ ID:6102 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:269.

[5604] Another function of GAM47 is therefore inhibition of LOC253221 (Accession XP_173010.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253221.

[5605] LOC254266 (Accession XP_173221.1) is another GAM47 target gene, herein designated TARGET GENE. LOC254266 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254266 BINDING SITE, designated SEQ ID:6802, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5606] Another function of GAM47 is therefore inhibition of LOC254266 (Accession XP_173221.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254266.

[5607] LOC255975 (Accession XP_171083.2) is another GAM47 target gene, herein designated TARGET GENE. LOC255975

BINDING SITE1 and LOC255975 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC255975, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE1 and LOC255975 BINDING SITE2, designated SEQ ID:11873 and SEQ ID:2592 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5608] Another function of GAM47 is therefore inhibition of LOC255975 (Accession XP_171083.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975.

[5609] LOC257239 (Accession XP_173125.1) is another GAM47 target gene, herein designated TARGET GENE. LOC257239 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257239, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257239 BINDING SITE, designated SEQ ID:17331, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5610] Another function of GAM47 is therefore inhibition of LOC257239 (Accession XP_173125.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257239.

[5611] LOC257358 (Accession XP_173138.1) is another GAM47 target gene, herein designated TARGET GENE. LOC257358 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257358, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257358 BINDING SITE, designated SEQ ID:12197, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5612] Another function of GAM47 is therefore inhibition of LOC257358 (Accession XP_173138.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257358.

[5613] LOC282890 (Accession XP_212581.1) is another GAM47

target gene, herein designated TARGET GENE. LOC282890 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282890, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282890 BINDING SITE, designated SEQ ID:6358, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5614] Another function of GAM47 is therefore inhibition of LOC282890 (Accession XP_212581.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282890.

[5615] LOC282927 (Accession XP_212629.1) is another GAM47 target gene, herein designated TARGET GENE. LOC282927 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282927 BINDING SITE, designated SEQ ID:6358, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5616] Another function of GAM47 is therefore inhibition of LOC282927 (Accession XP_212629.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282927.

[5617] LOC283049 (Accession XP_210868.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283049 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283049, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283049 BINDING SITE, designated SEQ ID:1447, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5618] Another function of GAM47 is therefore inhibition of LOC283049 (Accession XP_210868.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283049.

[5619] LOC283168 (Accession XP_210910.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283168

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283168, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283168 BINDING SITE, designated SEQ ID:3946, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5620] Another function of GAM47 is therefore inhibition of LOC283168 (Accession XP_210910.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283168.

[5621] LOC283199 (Accession XP_210929.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283199 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283199, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283199 BINDING SITE, designated SEQ ID:17013, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5622] Another function of GAM47 is therefore inhibition of LOC283199 (Accession XP_210929.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283199.

[5623] LOC283391 (Accession XP_208657.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283391 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283391, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283391 BINDING SITE, designated SEQ ID:11579, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5624] Another function of GAM47 is therefore inhibition of LOC283391 (Accession XP_208657.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283391.

[5625] LOC283442 (Accession XP_211037.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283442 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC283442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283442 BINDING SITE, designated SEQ ID:20097, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5626] Another function of GAM47 is therefore inhibition of LOC283442 (Accession XP_211037.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283442.

[5627] LOC283468 (Accession XP_211051.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283468 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283468, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283468 BINDING SITE, designated SEQ ID:1821, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5628] Another function of GAM47 is therefore inhibition of

LOC283468 (Accession XP_211051.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283468.

[5629] LOC283493 (Accession XP_208091.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283493 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283493 BINDING SITE, designated SEQ ID:1898, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5630] Another function of GAM47 is therefore inhibition of LOC283493 (Accession XP_208091.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283493.

[5631] LOC283526 (Accession XP_211081.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283526 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283526, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283526 BINDING SITE, designated SEQ ID:8927, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5632] Another function of GAM47 is therefore inhibition of LOC283526 (Accession XP_211081.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283526.

[5633] LOC283575 (Accession XP_211095.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283575 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283575, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283575 BINDING SITE, designated SEQ ID:15864, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5634] Another function of GAM47 is therefore inhibition of LOC283575 (Accession XP_211095.1) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283575.

[5635] LOC283582 (Accession XP_211119.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283582 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283582, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283582 BINDING SITE, designated SEQ ID:7987, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5636] Another function of GAM47 is therefore inhibition of LOC283582 (Accession XP_211119.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283582.

[5637] LOC283655 (Accession XP_211144.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283655 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283655, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283655 BINDING SITE, designated SEQ ID:19410, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5638] Another function of GAM47 is therefore inhibition of LOC283655 (Accession XP_211144.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283655.

[5639] LOC283690 (Accession XP_211167.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283690 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283690, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283690 BINDING SITE, designated SEQ ID:19850, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5640] Another function of GAM47 is therefore inhibition of LOC283690 (Accession XP_211167.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC283690.

[5641] LOC283701 (Accession XP_211170.3) is another GAM47 target gene, herein designated TARGET GENE. LOC283701 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283701, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283701 BINDING SITE, designated SEQ ID:16095, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5642] Another function of GAM47 is therefore inhibition of LOC283701 (Accession XP_211170.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283701.

[5643] LOC283728 (Accession XP_211183.3) is another GAM47 target gene, herein designated TARGET GENE. LOC283728 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC283728 BINDING SITE, designated SEQ ID:1631, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5644] Another function of GAM47 is therefore inhibition of LOC283728 (Accession XP_211183.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283728.

[5645] LOC283777 (Accession XP_208837.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283777 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283777, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283777 BINDING SITE, designated SEQ ID:10019, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5646] Another function of GAM47 is therefore inhibition of LOC283777 (Accession XP_208837.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC283777.

[5647] LOC283843 (Accession XP_208867.3) is another GAM47 target gene, herein designated TARGET GENE. LOC283843 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283843, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283843 BINDING SITE, designated SEQ ID:3242, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5648] Another function of GAM47 is therefore inhibition of LOC283843 (Accession XP_208867.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283843.

[5649] LOC283846 (Accession XP_208126.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283846 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283846, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283846 BINDING SITE, designated SEQ ID:3242, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5650] Another function of GAM47 is therefore inhibition of LOC283846 (Accession XP_208126.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283846.

[5651] LOC283851 (Accession XP_211229.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283851 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283851, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283851 BINDING SITE, designated SEQ ID:15767, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5652] Another function of GAM47 is therefore inhibition of LOC283851 (Accession XP_211229.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283851.

[5653] LOC283862 (Accession XP_211237.1) is another GAM47 target gene, herein designated TARGET GENE. LOC283862 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283862, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283862 BINDING SITE, designated SEQ ID:652, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5654] Another function of GAM47 is therefore inhibition of LOC283862 (Accession XP_211237.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283862.

[5655] LOC283911 (Accession XP_211259.2) is another GAM47 target gene, herein designated TARGET GENE. LOC283911 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283911 BINDING SITE, designated SEQ ID:18771, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5656] Another function of GAM47 is therefore inhibition of LOC283911 (Accession XP_211259.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283911.

[5657] LOC283963 (Accession XP_211275.2) is another GAM47 target gene, herein designated TARGET GENE. LOC283963 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283963 BINDING SITE, designated SEQ ID:10020, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5658] Another function of GAM47 is therefore inhibition of LOC283963 (Accession XP_211275.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283963.

[5659] LOC283980 (Accession XP_208940.2) is another GAM47

target gene, herein designated TARGET GENE. LOC283980 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283980, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283980 BINDING SITE, designated SEQ ID:8565, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5660] Another function of GAM47 is therefore inhibition of LOC283980 (Accession XP_208940.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283980.

[5661] LOC284077 (Accession XP_210779.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284077 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284077 BINDING SITE, designated SEQ ID:13640, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5662] Another function of GAM47 is therefore inhibition of LOC284077 (Accession XP_210779.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284077.

[5663] LOC284080 (Accession XP_211322.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284080 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284080 BINDING SITE, designated SEQ ID:15510, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5664] Another function of GAM47 is therefore inhibition of LOC284080 (Accession XP_211322.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284080.

[5665] LOC284095 (Accession XP_211324.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284095

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284095, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284095 BINDING SITE, designated SEQ ID:15774, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5666] Another function of GAM47 is therefore inhibition of LOC284095 (Accession XP_211324.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284095.

[5667] LOC284172 (Accession XP_211361.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284172 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284172, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284172 BINDING SITE, designated SEQ ID:13676, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5668] Another function of GAM47 is therefore inhibition of LOC284172 (Accession XP_211361.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284172.

[5669] LOC284219 (Accession XP_211385.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284219 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284219, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284219 BINDING SITE, designated SEQ ID:14057, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5670] Another function of GAM47 is therefore inhibition of LOC284219 (Accession XP_211385.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284219.

[5671] LOC284233 (Accession XP_211388.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284233 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284233, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284233 BINDING SITE, designated SEQ ID:705, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5672] Another function of GAM47 is therefore inhibition of LOC284233 (Accession XP_211388.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284233.

[5673] LOC284244 (Accession XP_211399.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284244 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284244, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284244 BINDING SITE, designated SEQ ID:3763, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5674] Another function of GAM47 is therefore inhibition of

LOC284244 (Accession XP_211399.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284244.

[5675] LOC284259 (Accession XP_211410.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284259 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284259 BINDING SITE, designated SEQ ID:8411, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5676] Another function of GAM47 is therefore inhibition of LOC284259 (Accession XP_211410.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284259.

[5677] LOC284267 (Accession XP_211411.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284267 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284267, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284267 BINDING SITE, designated SEQ ID:11107, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5678] Another function of GAM47 is therefore inhibition of LOC284267 (Accession XP_211411.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284267.

[5679] LOC284395 (Accession XP_211454.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284395 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284395, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284395 BINDING SITE, designated SEQ ID:1174, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5680] Another function of GAM47 is therefore inhibition of LOC284395 (Accession XP_211454.1) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284395.

[5681] LOC284433 (Accession XP_210787.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284433 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284433, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284433 BINDING SITE, designated SEQ ID:12213, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5682] Another function of GAM47 is therefore inhibition of LOC284433 (Accession XP_210787.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284433.

[5683] LOC284445 (Accession XP_209212.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284445 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284445, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284445 BINDING SITE, designated SEQ ID:18092, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5684] Another function of GAM47 is therefore inhibition of LOC284445 (Accession XP_209212.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284445.

[5685] LOC284456 (Accession XP_211470.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284456 BINDING SITE1 and LOC284456 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284456, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284456 BINDING SITE1 and LOC284456 BINDING SITE2, designated SEQ ID:18111 and SEQ ID:6952 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5686] Another function of GAM47 is therefore inhibition of

LOC284456 (Accession XP_211470.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284456.

[5687] LOC284473 (Accession XP_211474.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284473 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284473, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284473 BINDING SITE, designated SEQ ID:3315, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5688] Another function of GAM47 is therefore inhibition of LOC284473 (Accession XP_211474.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284473.

[5689] LOC284491 (Accession XP_211488.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284491 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284491, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284491 BINDING SITE, designated SEQ ID:598, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5690] Another function of GAM47 is therefore inhibition of LOC284491 (Accession XP_211488.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284491.

[5691] LOC284499 (Accession XP_209237.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284499 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284499, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284499 BINDING SITE, designated SEQ ID:1464, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5692] Another function of GAM47 is therefore inhibition of LOC284499 (Accession XP_209237.1) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284499.

[5693] LOC284559 (Accession XP_208220.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284559 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284559, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284559 BINDING SITE, designated SEQ ID:6672, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5694] Another function of GAM47 is therefore inhibition of LOC284559 (Accession XP_208220.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284559.

[5695] LOC284615 (Accession XP_211553.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284615 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284615, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284615 BINDING SITE, designated SEQ ID:9093, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5696] Another function of GAM47 is therefore inhibition of LOC284615 (Accession XP_211553.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284615.

[5697] LOC284688 (Accession XP_211588.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284688 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284688, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284688 BINDING SITE, designated SEQ ID:8169, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5698] Another function of GAM47 is therefore inhibition of LOC284688 (Accession XP_211588.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284688.

[5699] LOC284758 (Accession XP_211634.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284758 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284758, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284758 BINDING SITE, designated SEQ ID:18028, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5700] Another function of GAM47 is therefore inhibition of LOC284758 (Accession XP_211634.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284758.

[5701] LOC284836 (Accession XP_211654.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284836 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284836, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284836 BINDING SITE, designated SEQ ID:11298, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5702] Another function of GAM47 is therefore inhibition of LOC284836 (Accession XP_211654.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284836.

[5703] LOC284851 (Accession XP_211667.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284851 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284851, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284851 BINDING SITE, designated SEQ ID:4964, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5704] Another function of GAM47 is therefore inhibition of LOC284851 (Accession XP_211667.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284851.

[5705] LOC284858 (Accession XP_209386.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284858 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284858, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284858 BINDING SITE, designated SEQ ID:5108, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5706] Another function of GAM47 is therefore inhibition of LOC284858 (Accession XP_209386.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284858.

[5707] LOC284939 (Accession XP_211700.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284939 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284939, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC284939 BINDING SITE, designated SEQ ID:1266, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5708] Another function of GAM47 is therefore inhibition of LOC284939 (Accession XP_211700.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284939.

[5709] LOC284974 (Accession XP_211713.1) is another GAM47 target gene, herein designated TARGET GENE. LOC284974 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284974, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284974 BINDING SITE, designated SEQ ID:7359, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5710] Another function of GAM47 is therefore inhibition of LOC284974 (Accession XP_211713.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284974.

[5711] LOC285002 (Accession XP_211731.2) is another GAM47 target gene, herein designated TARGET GENE. LOC285002 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285002 BINDING SITE, designated SEQ ID:9504, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5712] Another function of GAM47 is therefore inhibition of LOC285002 (Accession XP_211731.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285002.

[5713] LOC285122 (Accession XP_211770.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285122 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285122 BINDING SITE, designated SEQ ID:18888, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5714] Another function of GAM47 is therefore inhibition of LOC285122 (Accession XP_211770.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285122.

[5715] LOC285329 (Accession XP_209569.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285329 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285329, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285329 BINDING SITE, designated SEQ ID:16710, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5716] Another function of GAM47 is therefore inhibition of LOC285329 (Accession XP_209569.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285329.

[5717] LOC285338 (Accession XP_209573.1) is another GAM47

target gene, herein designated TARGET GENE. LOC285338 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285338, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285338 BINDING SITE, designated SEQ ID:671, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5718] Another function of GAM47 is therefore inhibition of LOC285338 (Accession XP_209573.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285338.

[5719] LOC285369 (Accession XP_211861.3) is another GAM47 target gene, herein designated TARGET GENE. LOC285369 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285369, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285369 BINDING SITE, designated SEQ ID:19888, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5720] Another function of GAM47 is therefore inhibition of LOC285369 (Accession XP_211861.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285369.

[5721] LOC285402 (Accession XP_211884.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285402 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285402, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285402 BINDING SITE, designated SEQ ID:7301, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5722] Another function of GAM47 is therefore inhibition of LOC285402 (Accession XP_211884.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285402.

[5723] LOC285526 (Accession XP_211927.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285526

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285526, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285526 BINDING SITE, designated SEQ ID:14586, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5724] Another function of GAM47 is therefore inhibition of LOC285526 (Accession XP_211927.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285526.

[5725] LOC285544 (Accession XP_209655.2) is another GAM47 target gene, herein designated TARGET GENE. LOC285544 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285544, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285544 BINDING SITE, designated SEQ ID:1609, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5726] Another function of GAM47 is therefore inhibition of LOC285544 (Accession XP_209655.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285544.

[5727] LOC285647 (Accession XP_209700.3) is another GAM47 target gene, herein designated TARGET GENE. LOC285647 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285647, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285647 BINDING SITE, designated SEQ ID:7695, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5728] Another function of GAM47 is therefore inhibition of LOC285647 (Accession XP_209700.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285647.

[5729] LOC285654 (Accession XP_211975.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285654 BINDING SITE1 and LOC285654 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by LOC285654, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285654 BINDING SITE1 and LOC285654 BINDING SITE2, designated SEQ ID:18509 and SEQ ID:19966 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5730] Another function of GAM47 is therefore inhibition of LOC285654 (Accession XP_211975.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285654.

[5731] LOC285671 (Accession XP_209709.2) is another GAM47 target gene, herein designated TARGET GENE. LOC285671 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC285671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285671 BINDING SITE, designated SEQ ID:13387, to the nucleotide sequence of

GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5732] Another function of GAM47 is therefore inhibition of LOC285671 (Accession XP_209709.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285671.

[5733] LOC285682 (Accession XP_211979.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285682 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285682, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285682 BINDING SITE, designated SEQ ID:5657, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5734] Another function of GAM47 is therefore inhibition of LOC285682 (Accession XP_211979.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285682.

[5735] LOC285719 (Accession XP_211990.1) is another GAM47

target gene, herein designated TARGET GENE. LOC285719 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285719, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285719 BINDING SITE, designated SEQ ID:13540, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5736] Another function of GAM47 is therefore inhibition of LOC285719 (Accession XP_211990.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285719.

[5737] LOC285756 (Accession XP_209751.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285756 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285756, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285756 BINDING SITE, designated SEQ ID:3336, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5738] Another function of GAM47 is therefore inhibition of LOC285756 (Accession XP_209751.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285756.

[5739] LOC285805 (Accession XP_212027.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285805 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285805 BINDING SITE, designated SEQ ID:17058, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5740] Another function of GAM47 is therefore inhibition of LOC285805 (Accession XP_212027.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285805.

[5741] LOC285822 (Accession XP_209777.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285822

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285822, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285822 BINDING SITE, designated SEQ ID:17839, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5742] Another function of GAM47 is therefore inhibition of LOC285822 (Accession XP_209777.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285822.

[5743] LOC285908 (Accession XP_209812.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285908 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285908, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285908 BINDING SITE, designated SEQ ID:1135, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5744] Another function of GAM47 is therefore inhibition of LOC285908 (Accession XP_209812.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285908.

[5745] LOC285909 (Accession XP_209811.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285909 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285909 BINDING SITE, designated SEQ ID:6593, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5746] Another function of GAM47 is therefore inhibition of LOC285909 (Accession XP_209811.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285909.

[5747] LOC285915 (Accession XP_209802.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285915 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC285915, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285915 BINDING SITE, designated SEQ ID:15820, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5748] Another function of GAM47 is therefore inhibition of LOC285915 (Accession XP_209802.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285915.

[5749] LOC285931 (Accession NP_777609.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285931 BINDING SITE, designated SEQ ID:8682, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5750] Another function of GAM47 is therefore inhibition of

LOC285931 (Accession NP_777609.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285931.

[5751] LOC285951 (Accession XP_212090.1) is another GAM47 target gene, herein designated TARGET GENE. LOC285951 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285951, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285951 BINDING SITE, designated SEQ ID:1535, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5752] Another function of GAM47 is therefore inhibition of LOC285951 (Accession XP_212090.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285951.

[5753] LOC286007 (Accession XP_212133.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286007 BINDING SITE1 and LOC286007 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by LOC286007, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286007 BINDING SITE1 and LOC286007 BINDING SITE2, designated SEQ ID:3734 and SEQ ID:17618 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5754] Another function of GAM47 is therefore inhibition of LOC286007 (Accession XP_212133.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286007.

[5755] LOC286030 (Accession XP_209868.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286030 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286030, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286030 BINDING SITE, designated SEQ ID:3883, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5756] Another function of GAM47 is therefore inhibition of LOC286030 (Accession XP_209868.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286030.

[5757] LOC286041 (Accession XP_212140.3) is another GAM47 target gene, herein designated TARGET GENE. LOC286041 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286041, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286041 BINDING SITE, designated SEQ ID:18519, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5758] Another function of GAM47 is therefore inhibition of LOC286041 (Accession XP_212140.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286041.

[5759] LOC286078 (Accession XP_212163.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286078 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC286078, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286078 BINDING SITE, designated SEQ ID:7355, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5760] Another function of GAM47 is therefore inhibition of LOC286078 (Accession XP_212163.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286078.

[5761] LOC286154 (Accession XP_212204.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286154 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286154, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286154 BINDING SITE, designated SEQ ID:18003, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5762] Another function of GAM47 is therefore inhibition of

LOC286154 (Accession XP_212204.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286154.

[5763] LOC286208 (Accession XP_212230.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286208 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286208, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286208 BINDING SITE, designated SEQ ID:12697, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5764] Another function of GAM47 is therefore inhibition of LOC286208 (Accession XP_212230.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286208.

[5765] LOC286217 (Accession XP_212232.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286217 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286217, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286217 BINDING SITE, designated SEQ ID:4829, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5766] Another function of GAM47 is therefore inhibition of LOC286217 (Accession XP_212232.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286217.

[5767] LOC286332 (Accession XP_212273.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286332 BINDING SITE, designated SEQ ID:14402, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5768] Another function of GAM47 is therefore inhibition of LOC286332 (Accession XP_212273.1) . Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286332.

[5769] LOC286333 (Accession XP_212271.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286333 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286333, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286333 BINDING SITE, designated SEQ ID:14402, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5770] Another function of GAM47 is therefore inhibition of LOC286333 (Accession XP_212271.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286333.

[5771] LOC286399 (Accession NP_789789.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286399 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286399, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286399 BINDING SITE, designated SEQ ID:13526, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5772] Another function of GAM47 is therefore inhibition of LOC286399 (Accession NP_789789.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286399.

[5773] LOC286434 (Accession XP_301085.1) is another GAM47 target gene, herein designated TARGET GENE. LOC286434 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286434, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286434 BINDING SITE, designated SEQ ID:15266, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5774] Another function of GAM47 is therefore inhibition of LOC286434 (Accession XP_301085.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC286434.

[5775] LOC338817 (Accession XP_290588.1) is another GAM47 target gene, herein designated TARGET GENE. LOC338817 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338817 BINDING SITE, designated SEQ ID:1464, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5776] Another function of GAM47 is therefore inhibition of LOC338817 (Accession XP_290588.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338817.

[5777] LOC339056 (Accession XP_290675.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339056 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC339056 BINDING SITE, designated SEQ ID:3242, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5778] Another function of GAM47 is therefore inhibition of LOC339056 (Accession XP_290675.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339056.

[5779] LOC339166 (Accession XP_294837.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339166 BINDING SITE, designated SEQ ID:1464, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5780] Another function of GAM47 is therefore inhibition of LOC339166 (Accession XP_294837.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC339166.

[5781] LOC339184 (Accession XP_290743.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339184 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339184 BINDING SITE, designated SEQ ID:784, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5782] Another function of GAM47 is therefore inhibition of LOC339184 (Accession XP_290743.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339184.

[5783] LOC339212 (Accession XP_290271.2) is another GAM47 target gene, herein designated TARGET GENE. LOC339212 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339212, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC339212 BINDING SITE, designated SEQ ID:15710, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5784] Another function of GAM47 is therefore inhibition of LOC339212 (Accession XP_290271.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339212.

[5785] LOC339290 (Accession XP_294901.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339290 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339290, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339290 BINDING SITE, designated SEQ ID:9358, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5786] Another function of GAM47 is therefore inhibition of LOC339290 (Accession XP_294901.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339290.

[5787] LOC339298 (Accession XP_294903.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339298 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339298, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339298 BINDING SITE, designated SEQ ID:14984, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5788] Another function of GAM47 is therefore inhibition of LOC339298 (Accession XP_294903.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339298.

[5789] LOC339389 (Accession XP_290857.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339389 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339389, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339389 BINDING SITE, designated SEQ ID:5262, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5790] Another function of GAM47 is therefore inhibition of LOC339389 (Accession XP_290857.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339389.

[5791] LOC339417 (Accession XP_294944.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339417 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339417, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339417 BINDING SITE, designated SEQ ID:11819, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5792] Another function of GAM47 is therefore inhibition of LOC339417 (Accession XP_294944.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339417.

[5793] LOC339435 (Accession XP_294950.1) is another GAM47

target gene, herein designated TARGET GENE. LOC339435 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339435 BINDING SITE, designated SEQ ID:6001, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5794] Another function of GAM47 is therefore inhibition of LOC339435 (Accession XP_294950.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339435.

[5795] LOC339440 (Accession XP_294951.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339440 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339440, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339440 BINDING SITE, designated SEQ ID:18568, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5796] Another function of GAM47 is therefore inhibition of LOC339440 (Accession XP_294951.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339440.

[5797] LOC339738 (Accession XP_295048.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339738 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339738, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339738 BINDING SITE, designated SEQ ID:11933, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5798] Another function of GAM47 is therefore inhibition of LOC339738 (Accession XP_295048.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339738.

[5799] LOC339740 (Accession XP_290339.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339740

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339740, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339740 BINDING SITE, designated SEQ ID:7421, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5800] Another function of GAM47 is therefore inhibition of LOC339740 (Accession XP_290339.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339740.

[5801] LOC339975 (Accession XP_295115.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339975 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339975 BINDING SITE, designated SEQ ID:11593, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5802] Another function of GAM47 is therefore inhibition of LOC339975 (Accession XP_295115.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339975.

[5803] LOC339975 (Accession XP_295115.1) is another GAM47 target gene, herein designated TARGET GENE. LOC339975 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339975 BINDING SITE, designated SEQ ID:11593, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5804] Another function of GAM47 is therefore inhibition of LOC339975 (Accession XP_295115.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339975.

[5805] LOC340012 (Accession XP_291113.2) is another GAM47 target gene, herein designated TARGET GENE. LOC340012 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC340012, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340012 BINDING SITE, designated SEQ ID:18520, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5806] Another function of GAM47 is therefore inhibition of LOC340012 (Accession XP_291113.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340012.

[5807] LOC340024 (Accession XP_291120.2) is another GAM47 target gene, herein designated TARGET GENE. LOC340024 BINDING SITE1 and LOC340024 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC340024, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340024 BINDING SITE1 and LOC340024 BINDING SITE2, designated SEQ ID:15024 and SEQ ID:13577 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also

designated SEQ ID:269.

[5808] Another function of GAM47 is therefore inhibition of LOC340024 (Accession XP_291120.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340024.

[5809] LOC340073 (Accession XP_295149.1) is another GAM47 target gene, herein designated TARGET GENE. LOC340073 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340073, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340073 BINDING SITE, designated SEQ ID:4588, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5810] Another function of GAM47 is therefore inhibition of LOC340073 (Accession XP_295149.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340073.

[5811] LOC340150 (Accession XP_295167.1) is another GAM47 target gene, herein designated TARGET GENE. LOC340150

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340150, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340150 BINDING SITE, designated SEQ ID:3367, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5812] Another function of GAM47 is therefore inhibition of LOC340150 (Accession XP_295167.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340150.

[5813] LOC340290 (Accession XP_291214.1) is another GAM47 target gene, herein designated TARGET GENE. LOC340290 BINDING SITE1 and LOC340290 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC340290, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340290 BINDING SITE1 and LOC340290 BINDING SITE2, designated SEQ ID:1256 and SEQ ID:11873 respectively, to the nucleotide se-

quence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5814] Another function of GAM47 is therefore inhibition of LOC340290 (Accession XP_291214.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340290.

[5815] LOC340318 (Accession XP_290401.1) is another GAM47 target gene, herein designated TARGET GENE. LOC340318 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340318, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340318 BINDING SITE, designated SEQ ID:2631, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5816] Another function of GAM47 is therefore inhibition of LOC340318 (Accession XP_290401.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340318.

[5817] LOC340346 (Accession XP_295213.2) is another GAM47

target gene, herein designated TARGET GENE. LOC340346 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340346 BINDING SITE, designated SEQ ID:18568, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5818] Another function of GAM47 is therefore inhibition of LOC340346 (Accession XP_295213.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340346.

[5819] LOC340371 (Accession NP_848659.1) is another GAM47 target gene, herein designated TARGET GENE. LOC340371 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC340371, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340371 BINDING SITE, designated SEQ ID:2445, to the nucleotide sequence of GAM47

RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5820] Another function of GAM47 is therefore inhibition of LOC340371 (Accession NP_848659.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340371.

[5821] LOC340371 (Accession XP_291255.2) is another GAM47 target gene, herein designated TARGET GENE. LOC340371 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC340371, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340371 BINDING SITE, designated SEQ ID:2445, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5822] Another function of GAM47 is therefore inhibition of LOC340371 (Accession XP_291255.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340371.

[5823] LOC342663 (Accession XP_297028.1) is another GAM47 target gene, herein designated TARGET GENE. LOC342663 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC342663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342663 BINDING SITE, designated SEQ ID:1726, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5824] Another function of GAM47 is therefore inhibition of LOC342663 (Accession XP_297028.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342663.

[5825] LOC343895 (Accession XP_297948.1) is another GAM47 target gene, herein designated TARGET GENE. LOC343895 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC343895, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC343895 BINDING SITE, designated SEQ ID:19955, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5826] Another function of GAM47 is therefore inhibition of LOC343895 (Accession XP_297948.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC343895.

[5827] LOC344256 (Accession XP_297483.2) is another GAM47 target gene, herein designated TARGET GENE. LOC344256 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC344256, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC344256 BINDING SITE, designated SEQ ID:12043, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5828] Another function of GAM47 is therefore inhibition of LOC344256 (Accession XP_297483.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC344256.

[5829] LOC345190 (Accession XP_298603.1) is another GAM47

target gene, herein designated TARGET GENE. LOC345190 BINDING SITE1 and LOC345190 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC345190, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC345190 BINDING SITE1 and LOC345190 BINDING SITE2, designated SEQ ID:15447 and SEQ ID:17998 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5830] Another function of GAM47 is therefore inhibition of LOC345190 (Accession XP_298603.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC345190.

[5831] LOC347644 (Accession XP_300206.1) is another GAM47 target gene, herein designated TARGET GENE. LOC347644 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347644, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC347644 BINDING SITE, designated SEQ ID:6358, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5832] Another function of GAM47 is therefore inhibition of LOC347644 (Accession XP_300206.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347644.

[5833] LOC347924 (Accession XP_300570.1) is another GAM47 target gene, herein designated TARGET GENE. LOC347924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347924 BINDING SITE, designated SEQ ID:19514, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5834] Another function of GAM47 is therefore inhibition of LOC347924 (Accession XP_300570.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347924.

[5835] LOC348035 (Accession XP_300595.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348035 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348035 BINDING SITE, designated SEQ ID:13822, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5836] Another function of GAM47 is therefore inhibition of LOC348035 (Accession XP_300595.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348035.

[5837] LOC348075 (Accession XP_302653.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348075 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348075, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348075 BINDING SITE, designated SEQ ID:16095, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5838] Another function of GAM47 is therefore inhibition of LOC348075 (Accession XP_302653.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348075.

[5839] LOC348258 (Accession XP_300686.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348258 BINDING SITE1 and LOC348258 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348258, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348258 BINDING SITE1 and LOC348258 BINDING SITE2, designated SEQ ID:4358 and SEQ ID:670 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5840] Another function of GAM47 is therefore inhibition of LOC348258 (Accession XP_300686.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348258.

[5841] LOC348261 (Accession XP_302704.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348261 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348261, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348261 BINDING SITE, designated SEQ ID:3316, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5842] Another function of GAM47 is therefore inhibition of LOC348261 (Accession XP_302704.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348261.

[5843] LOC348373 (Accession XP_302735.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348373 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348373, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348373 BINDING SITE, designated SEQ ID:19986, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5844] Another function of GAM47 is therefore inhibition of LOC348373 (Accession XP_302735.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348373.

[5845] LOC348422 (Accession XP_301160.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348422 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348422, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348422 BINDING SITE, designated SEQ ID:15244, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5846] Another function of GAM47 is therefore inhibition of LOC348422 (Accession XP_301160.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348422.

[5847] LOC348427 (Accession XP_302755.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348427 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348427, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348427 BINDING SITE, designated SEQ ID:18772, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5848] Another function of GAM47 is therefore inhibition of LOC348427 (Accession XP_302755.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348427.

[5849] LOC348450 (Accession XP_302758.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348450 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348450 BINDING SITE, designated SEQ ID:18568, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5850] Another function of GAM47 is therefore inhibition of LOC348450 (Accession XP_302758.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348450.

[5851] LOC348528 (Accession XP_302814.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348528 BINDING SITE1 and LOC348528 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348528, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348528 BINDING SITE1 and LOC348528 BINDING SITE2, designated SEQ ID:18124 and SEQ ID:3438 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5852] Another function of GAM47 is therefore inhibition of LOC348528 (Accession XP_302814.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348528.

[5853] LOC348552 (Accession XP_209362.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348552 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348552, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348552 BINDING SITE, designated SEQ ID:967, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5854] Another function of GAM47 is therefore inhibition of LOC348552 (Accession XP_209362.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348552.

[5855] LOC348798 (Accession XP_300845.1) is another GAM47 target gene, herein designated TARGET GENE. LOC348798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348798 BINDING SITE, designated SEQ ID:6335, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5856] Another function of GAM47 is therefore inhibition of LOC348798 (Accession XP_300845.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348798.

[5857] LOC349062 (Accession XP_302948.1) is another GAM47 target gene, herein designated TARGET GENE. LOC349062 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349062, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349062 BINDING SITE, designated SEQ ID:15010, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5858] Another function of GAM47 is therefore inhibition of LOC349062 (Accession XP_302948.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349062.

[5859] LOC349339 (Accession XP_301042.1) is another GAM47 target gene, herein designated TARGET GENE. LOC349339 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349339, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349339 BINDING SITE, designated SEQ ID:18092, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5860] Another function of GAM47 is therefore inhibition of LOC349339 (Accession XP_301042.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349339.

[5861] LOC350629 (Accession XP_304260.1) is another GAM47 target gene, herein designated TARGET GENE. LOC350629 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC350629, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC350629 BINDING SITE, designated SEQ ID:15197, to

the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5862] Another function of GAM47 is therefore inhibition of LOC350629 (Accession XP_304260.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC350629.

[5863] LOC352258 (Accession XP_305527.1) is another GAM47 target gene, herein designated TARGET GENE. LOC352258 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC352258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC352258 BINDING SITE, designated SEQ ID:6201, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5864] Another function of GAM47 is therefore inhibition of LOC352258 (Accession XP_305527.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC352258.

[5865] LOC352287 (Accession XP_305558.1) is another GAM47

target gene, herein designated TARGET GENE. LOC352287 BINDING SITE1 and LOC352287 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC352287, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC352287 BINDING SITE1 and LOC352287 BINDING SITE2, designated SEQ ID:16371 and SEQ ID:3237 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5866] Another function of GAM47 is therefore inhibition of LOC352287 (Accession XP_305558.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC352287.

[5867] LOC51337 (Accession NP_057731.1) is another GAM47 target gene, herein designated TARGET GENE. LOC51337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC51337 BINDING SITE, designated SEQ ID:16030, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5868] Another function of GAM47 is therefore inhibition of LOC51337 (Accession NP_057731.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51337.

[5869] LOC56181 (Accession NP_062457.2) is another GAM47 target gene, herein designated TARGET GENE. LOC56181 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC56181, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC56181 BINDING SITE, designated SEQ ID:19514, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5870] Another function of GAM47 is therefore inhibition of LOC56181 (Accession NP_062457.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56181.

[5871] LOC90133 (Accession XP_029323.1) is another GAM47 target gene, herein designated TARGET GENE. LOC90133 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90133 BINDING SITE, designated SEQ ID:17943, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5872] Another function of GAM47 is therefore inhibition of LOC90133 (Accession XP_029323.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90133.

[5873] LOC90408 (Accession XP_031517.1) is another GAM47 target gene, herein designated TARGET GENE. LOC90408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:3764, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5874] Another function of GAM47 is therefore inhibition of LOC90408 (Accession XP_031517.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408.

[5875] LOC90841 (Accession XP_034427.2) is another GAM47 target gene, herein designated TARGET GENE. LOC90841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90841 BINDING SITE, designated SEQ ID:18600, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5876] Another function of GAM47 is therefore inhibition of LOC90841 (Accession XP_034427.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90841.

[5877] LOC91056 (Accession NP_612377.1) is another GAM47

target gene, herein designated TARGET GENE. LOC91056 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC91056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91056 BINDING SITE, designated SEQ ID:3924, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5878] Another function of GAM47 is therefore inhibition of LOC91056 (Accession NP_612377.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91056.

[5879] LOC91097 (Accession XP_035977.1) is another GAM47 target gene, herein designated TARGET GENE. LOC91097 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91097, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91097 BINDING SITE, designated SEQ ID:1470, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5880] Another function of GAM47 is therefore inhibition of LOC91097 (Accession XP_035977.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91097.

[5881] LOC91208 (Accession XP_036935.1) is another GAM47 target gene, herein designated TARGET GENE. LOC91208 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91208, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91208 BINDING SITE, designated SEQ ID:6400, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5882] Another function of GAM47 is therefore inhibition of LOC91208 (Accession XP_036935.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91208.

[5883] LOC91496 (Accession XP_038788.1) is another GAM47

target gene, herein designated TARGET GENE. LOC91496 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91496, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91496 BINDING SITE, designated SEQ ID:6539, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5884] Another function of GAM47 is therefore inhibition of LOC91496 (Accession XP_038788.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91496.

[5885] LOC91632 (Accession XP_039721.2) is another GAM47 target gene, herein designated TARGET GENE. LOC91632 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91632, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91632 BINDING SITE, designated SEQ ID:6540, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[5886] Another function of GAM47 is therefore inhibition of LOC91632 (Accession XP_039721.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91632.

[5887] LOC92148 (Accession XP_043160.1) is another GAM47 target gene, herein designated TARGET GENE. LOC92148 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92148, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92148 BINDING SITE, designated SEQ ID:18532, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5888] Another function of GAM47 is therefore inhibition of LOC92148 (Accession XP_043160.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92148.

[5889] LOC92659 (Accession XP_046434.3) is another GAM47 target gene, herein designated TARGET GENE. LOC92659

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92659, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92659 BINDING SITE, designated SEQ ID:3316, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5890] Another function of GAM47 is therefore inhibition of LOC92659 (Accession XP_046434.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92659.

[5891] LOC95803 (Accession XP_047816.5) is another GAM47 target gene, herein designated TARGET GENE. LOC95803 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC95803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC95803 BINDING SITE, designated SEQ ID:16795, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5892] Another function of GAM47 is therefore inhibition of LOC95803 (Accession XP_047816.5) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC95803.

[5893] LRP11 (Accession NP_116221.2) is another GAM47 target gene, herein designated TARGET GENE. LRP11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LRP11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LRP11 BINDING SITE, designated SEQ ID:15632, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5894] Another function of GAM47 is therefore inhibition of LRP11 (Accession NP_116221.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP11.

[5895] Leucine zipper protein 1 (LUZP1, Accession NP_361013.1) is another GAM47 target gene, herein designated TARGET GENE. LUZP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LUZP1,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LUZP1 BINDING SITE, designated SEQ ID:13539, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5896] Another function of GAM47 is therefore inhibition of Leucine zipper protein 1 (LUZP1, Accession NP_361013.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUZP1.

[5897] V-maf musculoaponeurotic fibrosarcoma oncogene homolog g (avian) (MAFG, Accession NP_002350.1) is another GAM47 target gene, herein designated TARGET GENE. MAFG BINDING SITE1 and MAFG BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MAFG, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAFG BINDING SITE1 and MAFG BINDING SITE2, designated SEQ ID:4358 and SEQ ID:670 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ

ID:269.

[5898] Another function of GAM47 is therefore inhibition of V-maf musculoaponeurotic fibrosarcoma oncogene homolog g (avian) (MAFG, Accession NP_002350.1), a gene which act as transcriptional repressors upon formation of homodimers however, they seem to serve as transcriptional activators by dimerizing with other (usually larger) basic-zipper proteins and recruiting them to specific dna- binding sites. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAFG.

[5899] The function of MAFG has been established by previous studies. The analysis of globin gene transcription serves as a model for understanding tissue- specific and developmental regulation of gene expression. Globin gene expression is regulated through nuclear factor erythroid- 2 (NFE2) elements located in enhancer- like locus control regions positioned many kb upstream of alpha- and beta-gene clusters. NFE2 DNA- binding activity consists of a heterodimer containing a ubiquitous small Maf protein (MafF, MafG, or MafK (OMIM Ref. No. 600197)) and the tissue- restricted protein p45 NFE2 (OMIM Ref. No. 601490). Both subunits are members of the activator pro-

tein- 1- like superfamily of basic leucine zipper (bZIP) proteins (see OMIM Ref. No. 165160). Blank et al. (1997) isolated a cDNA encoding human MAFG, which is expressed in a wide array of tissues and cell lines. They showed that human MAFG protein, like its chicken counterpart, is able to dimerize with p45 NFE2. A p45/MAFG heterodimer was fully functional in supporting expression of alpha- and beta- globin genes and in promoting erythroid differentiation in a p45- deficient mouse erythroleukemia cell line. Blank et al. (1997) showed that human MAFG contains at least 3 exons, which are separated by small introns. The first exon is not translated Motohashi et al. (2000) found that mouse embryos expressing abundant transgene- derived Mafk died of severe anemia, while lines expressing lower levels of small Maf lived to adulthood. Megakaryocytes from the latter overexpressing lines exhibited reduced proplatelet formation and MARE (Maf recognition element)- dependent transcription, phenocopying Mafg null mice (see OMIM Ref. No. Shavit et al. (1998)). When the Mafg null mice were bred to small Maf-overexpressing transgenic animals, both loss- and gain-of- function phenotypes were reversed

[5900]

[5901] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5902] Motohashi, H.; Katsuoka, F.; Shavit, J. A.; Engel, J. D.; Yamamoto, M. : Positive or negative MARE- dependent transcriptional regulation is determined by the abundance of small Maf proteins. Cell 103: 865- 875, 2000. ; and

[5903] Blank, V.; Kim, M. J.; Andrews, N. C. : Human MAFG is a functional partner for p45 NF- E2 in activating globin gene expression. Blood 89: 3925- 3935, 1997.

[5904] Further studies establishing the function and utilities of MAFG are found in John Hopkins OMIM database record ID 602020, and in cited publications listed in Table 5, which are hereby incorporated by reference.Methyl-cpg binding domain protein 4 (MBD4, Accession NP_003916.1) is another GAM47 target gene, herein designated TARGET GENE. MBD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MBD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBD4 BINDING SITE, designated SEQ ID:6697, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[5905] Another function of GAM47 is therefore inhibition of Methyl-cpg binding domain protein 4 (MBD4, Accession NP_003916.1), a gene which are likely to be mediators of the effects of DNA methylation in mammalian cells. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD4.

[5906] The function of MBD4 has been established by previous studies. DNA methylation is the major modification of eukaryotic genomes and plays an essential role in mammalian development. The MECP2 (OMIM Ref. No. 300005) and MBD1 (OMIM Ref. No. 156535) proteins bind specifically to methylated DNA via a methyl- CpG- binding domain (MBD). By searching an EST database for proteins containing an MBD- like motif, Hendrich and Bird (1998) identified human and mouse cDNAs encoding the 3 novel proteins MBD2 (OMIM Ref. No. 603547), MBD3 (OMIM Ref. No. 603573), and MBD4. The predicted 580- amino acid human MBD4 protein (GenBank AF072250) is 66% identical to mouse Mbd4. The authors found evidence of alternatively spliced human and mouse MBD4 transcripts; one form encodes a truncated human MBD4 protein lacking

the C- terminal 42 amino acids. Both MBD2 and MBD4 specifically bound methylated DNA in vitro and colocalized with methylated sequences in vivo. Hendrich and Bird (1998) concluded that MBD2 and MBD4 are likely to be mediators of the effects of DNA methylation in mammalian cells. The DNA mismatch repair (MMR) is a specialized system, highly conserved throughout evolution, involved in the maintenance of genomic integrity. To identify novel human genes that may function in MMR, Bellacosa et al. (1999) used the yeast interaction trap. Using the MMR protein MLH1 (OMIM Ref. No. 120436) as bait, they cloned MED1. The MED1 protein forms a complex with MLH1, binds to methyl- CpG- containing DNA, has homology to bacterial DNA repair glycosylases/lyases, and displays endonuclease activity. Transfection of a MED1 mutant lacking the MBD was associated with microsatellite instability. These findings suggested that MED1 is a human DNA repair protein that may be involved in MMR and, as such, may be a candidate eukaryotic homolog of the bacterial MMR endonuclease, MutH. In addition, these results suggested that cytosine methylation may play a role in human DNA repair. After submission of their manuscript, Bellacosa et al. (1999) learned that the pro-

tein they designated MED1 is identical to MBD4 described by Hendrich and Bird (1998). Using PCR on a hybrid panel and FISH, Hendrich et al. (1999) mapped the MBD4 gene to chromosome 3q. They mapped the mouse gene to chromosome 6. Riccio et al. (1999) mapped the MBD4 gene to chromosome 3q21- q22 by FISH.

[5907] Animal model experiments lend further support to the function of MBD4. Millar et al. (2002) generated Mbd4 knockout mice by targeted disruption. Mbd4 - /- mice had a 3- fold increase in the frequency of C- to- T transitions at CpG sites. When bred onto the Apc(Min/+) background (see OMIM Ref. No. 175100), Mbd4 - /- mice showed accelerated tumor formation with CpG- to- TpG mutations in the Apc gene. Thus, Millar et al. (2002) concluded that MBD4 suppresses CpG mutability and tumorigenesis in vivo.

[5908] It is appreciated that the abovementioned animal model for MBD4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[5909] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5910] Hendrich, B.; Bird, A. : Identification and characterization of a family of mammalian methyl- CpG binding proteins. Molec. Cell. Biol. 18: 6538- 6547, 1998. ; and

[5911] Millar, C. B.; Guy, J.; Sansom, O. J.; Selfridge, J.; Mac-Dougall, E.; Hendrich, B.; Keightley, P. D.; Bishop, S. M.; Clarke, A. R.; Bird, A. : Enhanced CpG mutability and tumorigenesis i.

[5912] Further studies establishing the function and utilities of MBD4 are found in John Hopkins OMIM database record ID 603574, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mcf.2 cell line derived transforming sequence-like (MCF2L, Accession NP_079255.2) is another GAM47 target gene, herein designated TARGET GENE. MCF2L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCF2L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCF2L BINDING SITE, designated SEQ ID:2630, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5913] Another function of GAM47 is therefore inhibition of Mcf.2 cell line derived transforming sequence-like (MCF2L, Ac-

cession NP_079255.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCF2L.

[5914] MCOLN2 (Accession NP_694991.1) is another GAM47 target gene, herein designated TARGET GENE. MCOLN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCOLN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCOLN2 BINDING SITE, designated SEQ ID:4917, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5915] Another function of GAM47 is therefore inhibition of MCOLN2 (Accession NP_694991.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCOLN2.

[5916] Mam domain containing glycosylphosphatidylinositol anchor 1 (MDGA1, Accession NP_705691.1) is another GAM47 target gene, herein designated TARGET GENE. MDGA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MDGA1, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MDGA1 BINDING SITE, designated SEQ ID:10254, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5917] Another function of GAM47 is therefore inhibition of Mam domain containing glycosylphosphatidylinositol anchor 1 (MDGA1, Accession NP_705691.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDGA1.

[5918] Membrane frizzled-related protein (MFRP, Accession NP_113621.1) is another GAM47 target gene, herein designated TARGET GENE. MFRP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MFRP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MFRP BINDING SITE, designated SEQ ID:9575, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5919] Another function of GAM47 is therefore inhibition of Membrane frizzled-related protein (MFRP, Accession NP_113621.1) . Accordingly, utilities of GAM47 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MFRP.

[5920] Max gene associated (MGA, Accession XP_031689.3) is another GAM47 target gene, herein designated TARGET GENE. MGA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGA BINDING SITE, designated SEQ ID:4593, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5921] Another function of GAM47 is therefore inhibition of Max gene associated (MGA, Accession XP_031689.3), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGA.

[5922] The function of MGA has been established by previous studies. Maltase- glucoamylase (MGA; EC 3.2.1.20) is a brush border membrane enzyme that plays a role in the final steps of digestion of starch. Naim et al. (1988) showed that it is synthesized as a single- chain polypep-

tide precursor, acquires N- and O- linked carbohydrates, and does not undergo intracellular or extracellular proteolytic cleavage. Nichols et al. (1998) purified and partially sequenced the human maltase- glucoamylase protein. By RT- PCR using degenerate oligonucleotides based on the MGA protein sequence, they isolated human small intestine MGA cDNAs. The deduced 1,857- amino acid MGA protein has a putative type II membrane anchor, 2 WIDMNE catalytic sites, which are characteristic of carbohydrate hydrolases such as sucrase- isomaltase (SI; 222900), and 2 glycosyl hydrolase family 31 signature 2 sequences. MGA also has 19 potential N- glycosylation sites and 253 potential O- glycosylation sites. The MGA protein shares 59% sequence identity with SI. RT- PCR detected MGA expression in human small intestine, granulocyte, and kidney but not in salivary gland or pancreas.

[5923]

[5924] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5925] Naim, H. Y.; Sterchi, E. E.; Lentze, M. J. : Structure, biosynthesis, and glycosylation of human small intestinal maltase- glucoamylase. J. Biol. Chem. 263: 19709- 19717,

1988. ; and

[5926] Nichols, B. L.; Eldering, J.; Avery, S.; Hahn, D.; Quaroni, A.; Sterchi, E. : Human small intestinal maltase- glucoamylase cDNA cloning: homology to sucrase- isomaltase. J. Biol. Chem. 273: 3.

[5927] Further studies establishing the function and utilities of MGA are found in John Hopkins OMIM database record ID 154360, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC11102 (Accession NP_115701.2) is another GAM47 target gene, herein designated TARGET GENE. MGC11102 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11102, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11102 BINDING SITE, designated SEQ ID:16794, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5928] Another function of GAM47 is therefore inhibition of MGC11102 (Accession NP_115701.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC11102.

[5929] MGC12760 (Accession NP_116112.1) is another GAM47 target gene, herein designated TARGET GENE. MGC12760 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC12760, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12760 BINDING SITE, designated SEQ ID:16318, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5930] Another function of GAM47 is therefore inhibition of MGC12760 (Accession NP_116112.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12760.

[5931] MGC14289 (Accession NP_542391.1) is another GAM47 target gene, herein designated TARGET GENE. MGC14289 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14289, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC14289 BINDING SITE, designated SEQ ID:20024, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5932] Another function of GAM47 is therefore inhibition of MGC14289 (Accession NP_542391.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14289.

[5933] MGC14376 (Accession NP_116284.1) is another GAM47 target gene, herein designated TARGET GENE. MGC14376 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14376 BINDING SITE, designated SEQ ID:12840, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5934] Another function of GAM47 is therefore inhibition of MGC14376 (Accession NP_116284.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14376.

[5935] MGC15429 (Accession NP_116139.1) is another GAM47 target gene, herein designated TARGET GENE. MGC15429 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15429, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15429 BINDING SITE, designated SEQ ID:12226, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5936] Another function of GAM47 is therefore inhibition of MGC15429 (Accession NP_116139.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15429.

[5937] MGC22014 (Accession XP_035307.1) is another GAM47 target gene, herein designated TARGET GENE. MGC22014 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC22014, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:3989, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5938] Another function of GAM47 is therefore inhibition of MGC22014 (Accession XP_035307.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014.

[5939] MGC2474 (Accession NP_076420.1) is another GAM47 target gene, herein designated TARGET GENE. MGC2474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:7232, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5940] Another function of GAM47 is therefore inhibition of MGC2474 (Accession NP_076420.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474.

[5941] MGC33215 (Accession NP_722517.1) is another GAM47 target gene, herein designated TARGET GENE. MGC33215

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33215, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33215 BINDING SITE, designated SEQ ID:19827, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5942] Another function of GAM47 is therefore inhibition of MGC33215 (Accession NP_722517.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33215.

[5943] MGC34728 (Accession NP_689746.1) is another GAM47 target gene, herein designated TARGET GENE. MGC34728 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC34728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34728 BINDING SITE, designated SEQ ID:1406, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5944] Another function of GAM47 is therefore inhibition of MGC34728 (Accession NP_689746.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34728.

[5945] MGC34800 (Accession NP_694959.1) is another GAM47 target gene, herein designated TARGET GENE. MGC34800 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC34800, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34800 BINDING SITE, designated SEQ ID:8668, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5946] Another function of GAM47 is therefore inhibition of MGC34800 (Accession NP_694959.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34800.

[5947] MGC40579 (Accession NP_689989.1) is another GAM47 target gene, herein designated TARGET GENE. MGC40579 BINDING SITE1 and MGC40579 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by MGC40579, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC40579 BINDING SITE1 and MGC40579 BINDING SITE2, designated SEQ ID:7455 and SEQ ID:9195 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5948] Another function of GAM47 is therefore inhibition of MGC40579 (Accession NP_689989.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40579.

[5949] MGC42105 (Accession NP_699192.1) is another GAM47 target gene, herein designated TARGET GENE. MGC42105 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC42105, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC42105 BINDING SITE, designated SEQ ID:1753, to the nucleotide sequence of GAM47 RNA, herein designated

GAM RNA, also designated SEQ ID:269.

[5950] Another function of GAM47 is therefore inhibition of MGC42105 (Accession NP_699192.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC42105.

[5951] MGC4504 (Accession NP_077016.1) is another GAM47 target gene, herein designated TARGET GENE. MGC4504 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4504, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4504 BINDING SITE, designated SEQ ID:2337, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5952] Another function of GAM47 is therefore inhibition of MGC4504 (Accession NP_077016.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4504.

[5953] MI-ER1 (Accession NP_065999.1) is another GAM47 target gene, herein designated TARGET GENE. MI-ER1 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by MI-ER1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MI-ER1 BINDING SITE, designated SEQ ID:10996, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5954] Another function of GAM47 is therefore inhibition of MI-ER1 (Accession NP_065999.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MI-ER1.

[5955] MIDORI (Accession NP_065829.1) is another GAM47 target gene, herein designated TARGET GENE. MIDORI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MIDORI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:16823, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5956] Another function of GAM47 is therefore inhibition of MIDORI (Accession NP_065829.1) . Accordingly, utilities of

GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIDORI.

[5957] Multiple inositol polyphosphate histidine phosphatase, 1 (MINPP1, Accession NP_004888.2) is another GAM47 target gene, herein designated TARGET GENE. MINPP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MINPP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MINPP1 BINDING SITE, designated SEQ ID:3843, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5958] Another function of GAM47 is therefore inhibition of Multiple inositol polyphosphate histidine phosphatase, 1 (MINPP1, Accession NP_004888.2), a gene which is Multiple inositol polyphosphate phosphatase 1 and therefore may be associated with Follicular thyroid adenoma, follicular thyroid carcinoma. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Follicular thyroid adenoma, follicular thyroid carcinoma, and of other diseases and clinical conditions associated with MINPP1.

[5959] The function of MINPP1 has been established by previous studies. Germline mutations in the tumor suppressor gene PTEN, which encodes a dual- specificity phosphatase, have been found in up to 80% of patients with Cowden syndrome, suggesting a role of PTEN in the pathogenesis of follicular thyroid tumors. Although somatic intragenic mutations in PTEN, which maps to 10q23.3, are rarely found in follicular tumors, loss of heterozygosity (LOH) of markers within 10q22- q24 occurs in about 25%. MINPP1, another phosphatase gene, had also been mapped to 10q23.3. MINPP1 has the ability to remove 3- phosphate from inositol phosphate substrates, a function that overlaps that of PTEN. Because of this overlapping function with PTEN and the physical location of MINPP1 to a region with frequent LOH in follicular thyroid tumors, Gimm et al. (2001) considered it to be an excellent candidate gene that could contribute to the pathogenesis of follicular thyroid tumors. They analyzed DNA from tumor and corresponding normal tissue from 23 patients with follicular thyroid adenoma (FA) and 15 patients with follicular thyroid carcinoma (FTC; 188470) for LOH or mutations at the MINPP1 locus. LOH was identified in 4 malignant and 3 benign tumors. One of these FTCs with LOH was found to

harbor a somatic ser41- to- leu mutation (S41L; 605391.0001). They also found 2 germline sequence variants, gln270 to arg (Q270R; 605391.0002) and IVS3+34T- A (605391.0003). Q270R was found in only 1 patient with FA but not in patients with FTC or normal controls. Interestingly, IVS3+34T- A was found in about 15% of FA cases and normal controls but not in patients with FTC. The authors concluded that these results suggest a role for MINPP1 in the pathogenesis of at least a subset of malignant follicular thyroid tumors, and that MINPP1 might act as a low penetrance predisposition allele for FTC.

[5960] Animal model experiments lend further support to the function of MINPP1. Chi et al. (2000) used homologous recombination to generate Minpp1- deficient mice. They observed that these mice were fertile, lacked obvious defects, and had normal chondrocyte differentiation. An increase in levels of cytosolic inositol polyphosphates was reversible by the introduction of Minpp1 to the ER, showing that ER- based Minpp1 plays a role in the maintenance of steady- state levels of these polyphosphates. In contrast, introduction into the cytosol of truncated Minpp1 lacking the ER- targeting domain reduced the polyphos-

phates to below their natural levels and was accompanied by slowed cellular proliferation.

[5961] It is appreciated that the abovementioned animal model for MINPP1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[5962] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5963] Chi, H.; Yang, X.; Kingsley, P. D.; O'Keefe, R. J.; Puzas, J. E.; Rosier, R. N.; Shears, S. B.; Reynolds, P. R. : Targeted deletion of Minpp1 provides new insight into the activity of multiple inositol polyphosphate phosphatase in vivo. Molec. Cell. Biol. 20: 6496- 6507, 2000. ; and

[5964] Gimm, O.; Chi, H.; Dahia, P. L. M.; Perren, A.; Hinze, R.; Komminoth, P.; Dralle, H.; Reynolds, P. R.; Eng, C. : Somatic mutation and germline variants of MINPP1, a phosphatase gene lo.

[5965] Further studies establishing the function and utilities of MINPP1 are found in John Hopkins OMIM database record ID 605391, and in cited publications listed in Table 5, which are hereby incorporated by reference.Meningioma (disrupted in balanced translocation) 1 (MN1, Accession

NP_002421.2) is another GAM47 target gene, herein designated TARGET GENE. MN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:16715, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5966] Another function of GAM47 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NP_002421.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1.

[5967] Molybdenum cofactor synthesis 1 (MOCS1, Accession NP_620306.1) is another GAM47 target gene, herein designated TARGET GENE. MOCS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MOCS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOCS1 BINDING SITE, designated SEQ ID:18692, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5968] Another function of GAM47 is therefore inhibition of Molybdenum cofactor synthesis 1 (MOCS1, Accession NP_620306.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS1.

[5969] Molybdenum cofactor synthesis 1 (MOCS1, Accession NP_005933.1) is another GAM47 target gene, herein designated TARGET GENE. MOCS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MOCS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOCS1 BINDING SITE, designated SEQ ID:18692, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5970] Another function of GAM47 is therefore inhibition of Molybdenum cofactor synthesis 1 (MOCS1, Accession NP_005933.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS1.

[5971] Molybdenum cofactor synthesis 1 (MOCS1, Accession NP_005934.2) is another GAM47 target gene, herein designated TARGET GENE. MOCS1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MOCS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOCS1 BINDING SITE, designated SEQ ID:18692, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5972] Another function of GAM47 is therefore inhibition of Molybdenum cofactor synthesis 1 (MOCS1, Accession NP_005934.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS1.

[5973] MOXD1 (Accession NP_056344.1) is another GAM47 target gene, herein designated TARGET GENE. MOXD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MOXD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOXD1

BINDING SITE, designated SEQ ID:5314, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5974] Another function of GAM47 is therefore inhibition of MOXD1 (Accession NP_056344.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOXD1.

[5975] MRF2 (Accession XP_084482.2) is another GAM47 target gene, herein designated TARGET GENE. MRF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRF2 BINDING SITE, designated SEQ ID:16396, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5976] Another function of GAM47 is therefore inhibition of MRF2 (Accession XP_084482.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRF2.

[5977] Mitochondrial ribosomal protein l10 (MRPL10, Accession NP_660298.2) is another GAM47 target gene, herein des-

ignated TARGET GENE. MRPL10 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MRPL10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL10 BINDING SITE, designated SEQ ID:9128, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5978] Another function of GAM47 is therefore inhibition of Mitochondrial ribosomal protein l10 (MRPL10, Accession NP_660298.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL10.

[5979] Mitochondrial ribosomal protein l10 (MRPL10, Accession NP_683685.1) is another GAM47 target gene, herein designated TARGET GENE. MRPL10 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MRPL10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL10 BINDING SITE, designated SEQ ID:9128, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5980] Another function of GAM47 is therefore inhibition of Mitochondrial ribosomal protein l10 (MRPL10, Accession NP_683685.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL10.

[5981] MTA3 (Accession XP_038567.5) is another GAM47 target gene, herein designated TARGET GENE. MTA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTA3 BINDING SITE, designated SEQ ID:1271, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5982] Another function of GAM47 is therefore inhibition of MTA3 (Accession XP_038567.5) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTA3.

[5983] Nucleosome assembly protein 1-like 2 (NAP1L2, Accession NP_068798.1) is another GAM47 target gene, herein

designated TARGET GENE. NAP1L2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NAP1L2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAP1L2 BINDING SITE, designated SEQ ID:9926, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5984] Another function of GAM47 is therefore inhibition of Nucleosome assembly protein 1-like 2 (NAP1L2, Accession NP_068798.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L2.

[5985] Nucleosome assembly protein 1-like 4 (NAP1L4, Accession NP_005960.1) is another GAM47 target gene, herein designated TARGET GENE. NAP1L4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NAP1L4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAP1L4 BINDING SITE, designated SEQ ID:10186, to the nucleotide se-

quence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5986] Another function of GAM47 is therefore inhibition of Nucleosome assembly protein 1-like 4 (NAP1L4, Accession NP_005960.1), a gene which may have a role as a histone chaperone. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L4.

[5987] The function of NAP1L4 has been established by previous studies. Hu et al. (1996) used a positional cloning approach to isolate a gene which is located 100 kb centromeric to the proximal Beckwith- Wiedemann breakpoint cluster region (BWS; 130650) on chromosome 11p15. This gene is homologous to the yeast nucleosome assembly protein NAP1 (OMIM Ref. No. 164060). The authors designated the new gene NAP2. They demonstrated that this gene shows biallelic expression in all tissues tested and that it therefore diverges in its expression from IGF2 (OMIM Ref. No. 147470), H19 (OMIM Ref. No. 103280), and p57(KIP2) (OMIM Ref. No. 600856), which also map to 11p15.5 in the vicinity of the BWS gene. The NAP2 gene encodes a highly acidic protein of 375 amino acids. A 1,200- bp 3- prime untranslated region was

present. Rodriguez et al. (1997) reported that the NAP1L4 gene consists of 14 exons and spans approximately 30.5 kb. Histones are thought to play a key role in regulating gene expression at the level of DNA packaging. The deduced amino acid sequence of NAP2 indicates that it is a protein with a potential nuclear localization motif and 2 clusters of highly acidic residues. By functional analysis of recombinant NAP2 protein purified from Escherichia coli, Rodriguez et al. (1997) found that this protein can interact with both core and linker histones (see OMIM Ref. No. 142709). They demonstrated that recombinant NAP2 can transfer histones onto naked DNA templates. Subcellular localization studies of NAP2 indicated that it can shuttle between the cytoplasm and nucleus, suggesting a role as a histone chaperone. NAP1L4 maps to a region implicated in Wilms tumor etiology (see OMIM Ref. No. 194071). Rodriguez et al. (1997) analyzed the gene encoding NAP2 for mutations and found no evidence of nonsense, frameshift, or deletion mutations. Their findings, coupled with tumor suppression assays in Wilms tumor cells, did not support a role for NAP2 in the etiology of that neoplasm.

[5988]

[5989] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[5990] Hu, R.- J.; Lee, M. P.; Johnson, L. A.; Feinberg, A. P. : A novel human homologue of yeast nucleosome assembly protein, 65 kb centromeric to the p57(KIP2) gene, is bial- lelically expressed in fetal and adult tissues. Hum. Molec. Genet. 5: 1743- 1748, 1996. ; and

[5991] Rodriguez, P.; Munroe, D.; Prawitt, D.; Chu, L. L.; Bric, E.; Kim, J.; Reid, L. H.; Davies, C.; Nakagama, H.; Loebbert, R.; Winterpacht, A.; Petruzzi, M.- J.; Higgins, M. J.; Nowak, N.;.

[5992] Further studies establishing the function and utilities of NAP1L4 are found in John Hopkins OMIM database record ID 601651, and in cited publications listed in Table 5, which are hereby incorporated by refer- ence.Neuroblastoma, suppression of tumorigenicity 1 (NBL1, Accession NP_005371.1) is another GAM47 target gene, herein designated TARGET GENE. NBL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NBL1, corresponding to a tar- get binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple- mentarity of the nucleotide sequences of NBL1 BINDING

SITE, designated SEQ ID:10001, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5993] Another function of GAM47 is therefore inhibition of Neuroblastoma, suppression of tumorigenicity 1 (NBL1, Accession NP_005371.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBL1.

[5994] N-myc downstream regulated gene 1 (NDRG1, Accession NP_006087.1) is another GAM47 target gene, herein designated TARGET GENE. NDRG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NDRG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDRG1 BINDING SITE, designated SEQ ID:3602, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[5995] Another function of GAM47 is therefore inhibition of N-myc downstream regulated gene 1 (NDRG1, Accession NP_006087.1), a gene which may have a growth inhibitory role. and therefore may be associated with Hereditary motor and sensory neuropathy, lom type. Accordingly, utili-

ties of GAM47 include diagnosis, prevention and treatment of Hereditary motor and sensory neuropathy, lom type, and of other diseases and clinical conditions associated with NDRG1.

[5996] The function of NDRG1 has been established by previous studies. Using mRNA differential display analysis to compare expression in cells cultured in the presence of 1% or 20% oxygen, Park et al. (2000) determined that NDRG1, which they called PROXY1, is markedly upregulated in hypoxic cells. Northern and Western blot analyses showed that the 43- kD NDRG1 protein has a longer half- life than does the mRNA transcript and that the upregulation occurs through a heme protein- dependent pathway. Autosomal recessive peripheral neuropathies are relatively rare but are clinically more severe than autosomal dominant forms of Charcot- Marie- Tooth disease (CMT). The Lom form of hereditary motor and sensory neuropathy (HMSNL; 601455), or CMT4D, is one such disorder. HMSNL shows features of Schwann cell dysfunction and a concomitant early axonal involvement, suggesting that impaired axon-glia interactions play a major role in its pathogenesis. Kalaydjieva et al. (1996) mapped the disease gene to 8q24.3, where closely related disease haplotypes and

strong linkage disequilibrium suggested a single founder mutation. Kalaydjieva et al. (2000) reduced the HSMNL interval to 200 kb and characterized it by means of large-scale genomic sequencing. Sequence analysis of 2 genes located in the critical region, NDRG1 and WISP1 (OMIM Ref. No. 603398), identified the founder HMSNL mutation, a nonsense arg148- to- ter mutation (605262.0001) in the NDRG1 gene.

[5997]

[5998] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[5999] Kalaydjieva, L.; Gresham, D.; Gooding, R.; Heather, L.; Baas, F.; de Jonge, R.; Blechschmidt, K.; Angelicheva, D.; Chandler, D.; Worsley, P.; Rosenthal, A.; King, R. H. M.; Thomas, P. K. : N- myc downstream- regulated gene 1 is mutated in hereditary motor and sensory neuropathy-Lom. Am. J. Hum. Genet. 67: 47- 58, 2000. ; and

[6000] Park, H,; Adams, M. A.; Lachat, P.; Bosman, F.; Pang, S. C.; Graham, C. H. : Hypoxia induces the expression of a 43-kDa protein (PROXY- 1) in normal and malignant cells. Biochem. Bioph.

[6001] Further studies establishing the function and utilities of

NDRG1 are found in John Hopkins OMIM database record ID 605262, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nadh dehydrogenase (ubiquinone) 1 alpha subcomplex, 6, 14kda (NDUFA6, Accession NP_002481.1) is another GAM47 target gene, herein designated TARGET GENE. NDUFA6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NDUFA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDUFA6 BINDING SITE, designated SEQ ID:13883, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6002] Another function of GAM47 is therefore inhibition of Nadh dehydrogenase (ubiquinone) 1 alpha subcomplex, 6, 14kda (NDUFA6, Accession NP_002481.1), a gene which transfers electrons from nadh to the respiratory chain. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFA6.

[6003] The function of NDUFA6 has been established by previous studies. See NDUFA2 (OMIM Ref. No. 602137). Dunbar et

al. (1997) mapped the NDUFA6 gene to 21q22 by fluorescence in situ hybridization (FISH). However, by intron-based radiation hybrid mapping, Emahazion and Brookes (1998) assigned the NDUFA6 gene to 22q13.1. They stated that subsequent mapping studies with subfragments of the FISH- mapped recombinants of Dunbar et al. (1997) suggested chimerism and confirmed that the earlier FISH data were flawed. Ton et al. (1997) isolated human heart cDNAs encoding CI- B14 (OMIM Ref. No. NDUFA6) and 4 other complex I subunits.

[6004]

[6005] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6006] Dunbar, D. R.; Shibasaki, Y.; Dobbie, L.; Andersson, B.; Brookes, A. J. : In situ hybridisation mapping of genomic clones for five human respiratory chain complex I genes. Cytogenet. Cell Genet. 78: 21- 24, 1997. ; and

[6007] Emahazion, T.; Brookes, A. J. : Mapping of the NDUFA2, NDUFA6, NDUFA7, NDUFB8, and NDUFS8 electron transport chain genes by intron based radiation hybrid mapping. Cytogenet. Cell Genet.

[6008] Further studies establishing the function and utilities of

NDUFA6 are found in John Hopkins OMIM database record ID 602138, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear factor of activated t-cells, cytoplasmic, calcineurin-dependent 4 (NFATC4, Accession NP_004545.2) is another GAM47 target gene, herein designated TARGET GENE. NFATC4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NFATC4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFATC4 BINDING SITE, designated SEQ ID:11848, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6009] Another function of GAM47 is therefore inhibition of Nuclear factor of activated t-cells, cytoplasmic, calcineurin-dependent 4 (NFATC4, Accession NP_004545.2), a gene which plays a role in the inducible expression of cytokine genes in Tcells. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFATC4.

[6010] The function of NFATC4 has been established by previous studies. The activation of NFAT proteins is controlled by

calcineurin, the calmodulin- dependent phosphatase. Aramburu et al. (1998) identified a short conserved sequence in the NFATC4 protein (residues 105- 117) that targets calcineurin to NFAT. Mutation of a single residue in this sequence impairs the calcineurin- mediated dephosphorylation and nuclear translocation of NFAT1. Peptides spanning the region inhibit the ability of calcineurin to bind to and dephosphorylate NFAT proteins, without affecting the phosphatase activity of calcineurin against other substrates. When expressed intracellularly, a corresponding peptide inhibits NFAT dephosphorylation, nuclear translocation, and NFAT- mediated expression in response to stimulation. Thus, disruption of the enzyme-substrate docking interaction that directs calcineurin to NFAT can effectively block NFAT- dependent functions

[6011] Animal model experiments lend further support to the function of NFATC4. Graef et al. (2001) found that mice with disruptions of both the Nfatc4 and Nfatc3 genes died around embryonic day 11 (E11) with generalized defects in vessel assembly as well as excessive and disorganized growth of vessels into the neural tube and somites. Since calcineurin was thought to control nuclear localization of NFATC proteins, the authors introduced a mutation into

the calcineurin B gene (OMIM Ref. No. 601302) that prevented phosphatase activation by calcium signals. These calcineurin B mutant mice exhibited vascular developmental abnormalities similar to those of the Nfatc3/Nfatc4 null mice. Graef et al. (2001) showed that calcineurin function was transiently required between E7.5 and E8.5. They concluded that early calcineurin/NFAT signaling initiates the later cross- talk between vessels and surrounding tissues that pattern the vasculature

[6012] It is appreciated that the abovementioned animal model for NFATC4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6013] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6014] Graef, I. A.; Chen, F.; Chen, L.; Kuo, A.; Crabtree, G. R. : Signals transduced by Ca(2+)/calcineurin and NFATc3/c4 pattern the developing vasculature. Cell 105: 863- 875, 2001. ; and

[6015] Aramburu, J.; Garcia- Cozar, F.; Raghavan, A.; Okamura, H.; Rao, A.; Hogan, P. G. : Selective inhibition of NFAT activation by a peptide spanning the calcineurin targeting

site of NFAT. Mol.

[6016] Further studies establishing the function and utilities of NFATC4 are found in John Hopkins OMIM database record ID 602699, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) is another GAM47 target gene, herein designated TARGET GENE. NIPSNAP1 BINDING SITE1 and NIPSNAP1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NIPSNAP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NIPSNAP1 BINDING SITE1 and NIPSNAP1 BINDING SITE2, designated SEQ ID:15009 and SEQ ID:2560 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6017] Another function of GAM47 is therefore inhibition of Nipsnap homolog 1 (c. elegans) (NIPSNAP1, Accession NP_003625.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIPSNAP1.

[6018] Neuroligin 4 (NLGN4, Accession NP_065793.1) is another

GAM47 target gene, herein designated TARGET GENE. NLGN4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NLGN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NLGN4 BINDING SITE, designated SEQ ID:11053, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6019] Another function of GAM47 is therefore inhibition of Neuroligin 4 (NLGN4, Accession NP_065793.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLGN4.

[6020] Neuroligin 4 (NLGN4, Accession NP_851849.1) is another GAM47 target gene, herein designated TARGET GENE. NLGN4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NLGN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NLGN4 BINDING SITE, designated SEQ ID:11053, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[6021] Another function of GAM47 is therefore inhibition of Neuroligin 4 (NLGN4, Accession NP_851849.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLGN4.

[6022] Nucleolar protein 3 (apoptosis repressor with card domain) (NOL3, Accession NP_003937.1) is another GAM47 target gene, herein designated TARGET GENE. NOL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NOL3 BINDING SITE, designated SEQ ID:4812, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6023] Another function of GAM47 is therefore inhibition of Nucleolar protein 3 (apoptosis repressor with card domain) (NOL3, Accession NP_003937.1), a gene which inhibits CASP2 and CASP8 and interacts with splicing factors. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with NOL3.

[6024] The function of NOL3 has been established by previous studies. By searching an EST database for apoptosis- regulating proteins with homology to the caspase recruitment domain (CARD) of caspase- 9 (CASP9; 602234), Koseki et al. (1998) identified a cDNA encoding ARC (apoptosis repressor with CARD). Sequence analysis predicted that the 208- amino acid ARC protein contains an N- terminal CARD and a C- terminal region rich in proline and glutamic acid. Northern blot analysis detected 5.5- and 1.0-kb ARC transcripts in skeletal muscle and heart, but no expression was detected in brain, placenta, lung, liver, kidney, pancreas, and lymphoid/hematopoietic tissues. To identify proteins involved in RNA processing, Stoss et al. (1999) used a yeast 2- hybrid screen with SRp30c (SFRS9; 601943) as bait on a HeLa library. They isolated a cDNA encoding a protein that they designated NOP30 (nucleolar protein of 30 kD) based on SDS- PAGE analysis. The authors also identified a cDNA encoding a smaller isoform that they termed MYC (muscle- enriched cytosolic protein), which is created by a frameshift and is identical to the ARC protein reported by Koseki et al. (1998). MYC did not interact with SFRS9. Sequence analysis of the 219-

amino acid NOP30 protein predicted that it contains a highly acidic N terminus and a basic C terminus enriched with arginines, serines, and prolines and having multiple phosphorylation sites. Northern blot analysis detected 1.8- and 1.3- kb NOP30 transcripts, with highest expression in heart and skeletal muscle and weak expression in other tissues. In contrast, SFRS9 is relatively strongly and ubiquitously expressed as a 1.35- kb transcript. In situ hybridization analysis showed that NOP30 is expressed in the pia mater, a tissue surrounding the brain containing blood vessels lined with smooth muscle cells. Binding analysis indicated that NOP30 binds to itself and that the N and C termini of NOP30 interact with SFRS9 through its RS domain. Confocal microscopy demonstrated that NOP30, through its arginine- rich C terminus, colocalizes with B23 (NPM1; 164040) in the granular component of nucleoli; however, the majority of NOP30 was localized in the fibrillar component. NOP30 and SFRS9 colocalized in the nucleoplasm. In contrast, MYP, with its acidic N terminus, was predominantly localized in the cytoplasm.

[6025]

[6026] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[6027] Koseki, T.; Inohara, N.; Chen, S.; Nunez, G. : ARC, an inhibitor of apoptosis expressed in skeletal muscle and heart that interacts selectively with caspases. Proc. Nat. Acad. Sci. 95: 5156- 5160, 1998. ; and

[6028] Stoss, O.; Schwaiger, F.- W.; Cooper, T. A.; Stamm, S. : Alternative splicing determines the intracellular localization of the novel nuclear protein Nop30 and its interaction with the sp.

[6029] Further studies establishing the function and utilities of NOL3 are found in John Hopkins OMIM database record ID 605235, and in cited publications listed in Table 5, which are hereby incorporated by reference.Notch homolog 2 (drosophila) (NOTCH2, Accession NP_077719.2) is another GAM47 target gene, herein designated TARGET GENE. NOTCH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NOTCH2 BINDING SITE, designated SEQ ID:4571, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6030] Another function of GAM47 is therefore inhibition of Notch homolog 2 (drosophila) (NOTCH2, Accession NP_077719.2), a gene which is moderately similar to a region of murine Notch1 and contains an ankyrin repeat. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOTCH2.

[6031] The function of NOTCH2 has been established by previous studies. In Drosophila, the 'Notch' gene controls differentiation to various cell fates in many tissues. Three mammalian 'Notch' homologs have been identified. All 3 are very highly conserved relative to the Drosophila gene, which suggests that they are important for cell differentiation in mammals. This notion is supported by the previous finding of a truncated, translocated form of the human NOTCH1 (OMIM Ref. No. 190198) gene (formerly TAN1) in 3 cases of leukemia. Larsson et al. (1994) identified cosmid clones for all 3 human NOTCH genes. Using these clones as probes in fluorescence in situ hybridization to human metaphase chromosomes, they obtained results which, combined with data from somatic cell hybrid panels, demonstrated that NOTCH2 is located on 1p13- p11 and NOTCH3 on 19p13.2- p13.1, which are

regions of neoplasia- associated translocation. As part of a study of a triplication of several Mb occurring on chromosomes 1, 6, and 9, Katsanis et al. (1996) confirmed the presence of a NOTCH locus on chromosome 1. Gao et al. (1998) mapped the mouse Notch2 gene to chromosome 3.

[6032]

[6033] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6034] Katsanis, N.; Fitzgibbon, J.; Fisher, E. M. C. : Paralogy mapping: identification of a region in the human MHC triplicated onto human chromosomes 1 and 9 allows the prediction and isolation of novel PBX and NOTCH loci. Genomics 35: 101- 108, 1996. ; and

[6035] Larsson, C.; Lardelli, M.; White, I.; Lendahl, U. : The human NOTCH1, 2, and 3 genes are located at chromosome positions 9q34, 1p13- p11, and 19p13.2- p13.1 in regions of neoplasia- associa.

[6036] Further studies establishing the function and utilities of NOTCH2 are found in John Hopkins OMIM database record ID 600275, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nephronophthisis 4 (NPHP4, Accession

NP_055917.1) is another GAM47 target gene, herein designated TARGET GENE. NPHP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPHP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPHP4 BINDING SITE, designated SEQ ID:5716, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6037] Another function of GAM47 is therefore inhibition of Nephronophthisis 4 (NPHP4, Accession NP_055917.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPHP4.

[6038] Nuclear receptor subfamily 2, group f, member 6 (NR2F6, Accession NP_005225.2) is another GAM47 target gene, herein designated TARGET GENE. NR2F6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NR2F6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR2F6 BINDING SITE, designated SEQ ID:3179, to the nucleotide sequence of

GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6039] Another function of GAM47 is therefore inhibition of Nuclear receptor subfamily 2, group f, member 6 (NR2F6, Accession NP_005225.2), a gene which is similar to receptors for steroid hormones or thyroid hormone and contains a DNA binding domain. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2F6.

[6040] The function of NR2F6 has been established by previous studies. Miyajima et al. (1988) identified in the human genome 2 ERBA- related genes, named EAR2 and EAR3 (OMIM Ref. No. 132890), and characterized them by cDNA cloning. The genes are predicted to encode proteins very similar in primary structure to receptors for steroid hormones and thyroid hormone. In addition, the amino acid sequences of the 2 gene products are very similar to each other, especially in the DNA- binding domain (86% homology) and at the putative ligand- binding domain (76% homology). Northern hybridization using EAR DNA probes with RNAs from various tissues of the human fetus showed that the expression of EAR2 is high in the liver, whereas the expression of EAR3 is relatively ubiquitous.

Hybridization analysis of DNAs from sorted chromosomes showed that the EAR2 gene is located on chromosome 19 and the EAR3 gene on chromosome 5. Bahler et al. (1997) performed cosmid contig mapping indicating that the NR2F6 gene was 100 kb proximal to MYO9B (OMIM Ref. No. 602129) on chromosome 19p13.1.

[6041]

[6042] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6044] Miyajima, N.; Kadowaki, Y.; Fukushige, S.; Shimizu, S.; Semba, K.; Yamanashi, Y.; Matsubara, K.; Toyoshima, K.; Yamamoto, T. : Identification of two novel members of erbA superfamily by.

[6045] Further studies establishing the function and utilities of NR2F6 are found in John Hopkins OMIM database record ID 132880, and in cited publications listed in Table 5, which are hereby incorporated by reference.Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663163.1)

is another GAM47 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:13242, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6046] Another function of GAM47 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663163.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[6047] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663164.1) is another GAM47 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OS-

BPL3 BINDING SITE, designated SEQ ID:13242, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6048] Another function of GAM47 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663164.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[6049] OTOP3 (Accession XP_292588.2) is another GAM47 target gene, herein designated TARGET GENE. OTOP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by OTOP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OTOP3 BINDING SITE, designated SEQ ID:1725, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6050] Another function of GAM47 is therefore inhibition of OTOP3 (Accession XP_292588.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTOP3.

[6051] Phenylalanine hydroxylase (PAH, Accession NP_000268.1)

is another GAM47 target gene, herein designated TARGET GENE. PAH BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PAH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAH BINDING SITE, designated SEQ ID:1332, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6052] Another function of GAM47 is therefore inhibition of Phenylalanine hydroxylase (PAH, Accession NP_000268.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAH.

[6053] Pantothenate kinase 4 (PANK4, Accession NP_060686.1) is another GAM47 target gene, herein designated TARGET GENE. PANK4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PANK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PANK4 BINDING SITE, designated SEQ ID:18928, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[6054] Another function of GAM47 is therefore inhibition of Pantothenate kinase 4 (PANK4, Accession NP_060686.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PANK4.

[6055] Poly(a) polymerase beta (testis specific) (PAPOLB, Accession NP_064529.2) is another GAM47 target gene, herein designated TARGET GENE. PAPOLB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAPOLB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAPOLB BINDING SITE, designated SEQ ID:2967, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6056] Another function of GAM47 is therefore inhibition of Poly(a) polymerase beta (testis specific) (PAPOLB, Accession NP_064529.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAPOLB.

[6057] Paired box gene 2 (PAX2, Accession NP_003980.1) is an-

other GAM47 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:5547, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6058] Another function of GAM47 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_003980.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[6059] The function of PAX2 has been established by previous studies. Sanyanusin et al. (1996) obtained the complete genomic structure of the human PAX2 gene. They described 5 genomic lambda clones containing human PAX2 gene sequences, 4 of which had previously been reported by them (Sanyanusin et al., 1995). The fifth clone, which

included exons 7 and 8, was obtained by Sanyanusin et al. (1996) from a subgenomic lambda cDNA library of size-fractionated EcoRI fragments ranging in size from 6 to 8 kb. Sequencing and restriction mapping of these clones showed that the human PAX2 gene is composed of 12 exons spanning approximately 70 kb. They also found 2 alternatively spliced exons corresponding to exon 10 (Ward et al., 1994) and a 69- bp inserted sequence that they designated as exon 6. The 69- bp insert is homologous to a 69- bp insert reported in the murine Pax2 gene by Dressler et al. (1990). Sanyanusin et al. (1996) identified a (CA)n dinucleotide repeat polymorphism in PAX2 which they mapped immediately upstream of exon 9. The PAX2 gene is expressed in primitive cells of the kidney, ureter, eye, ear, and central nervous system. Based on the known expression pattern of PAX2, Sanyanusin et al. (1995) predicted that the phenotype caused by mutations of PAX2 would probably consist of autosomal dominant eye malformations, sensorineural hearing loss, and renal hypoplasia. Pursuing this suspicion, they found deletion of a single nucleotide in exon 5 of the PAX2 gene (167409.0001) in a father and 3 of his 5 sons who had optic nerve colobomas, renal hypoplasia, mild proteinuria,

and vesicoureteral reflux. The nucleotide deletion caused a frameshift in the conserved octapeptide sequence. The phenotype was similar to that of Krd mutant mice which lack a portion of chromosome 19 that is homologous to human 10q24 and includes the Pax2 gene. These mice have reduced thickness of the renal cortex, a reduced number of glomeruli at birth, and reduced amplitudes on electroretinogram. In the Krd mouse, the deletion of chromosome 19 was transgene- induced (Keller et al., 1994). Coloboma of the optic nerve with renal disease (OMIM Ref. No. 120330) is a recognized syndrome. Renal dysplasia and retinal aplasia are combined in the Loken- Senior syndrome (OMIM Ref. No. 266900). Ocular abnormalities occur also with familial juvenile nephronophthisis (OMIM Ref. No. 256100), but that disorder maps to chromosome 2.

[6060] Animal model experiments lend further support to the function of PAX2. To determine the direct effects of PAX2 mutations on kidney development, fetal kidneys of mice carrying a Pax2(1Neu) mutation were examined. At embryonic day 15 (E15), heterozygous mutant kidneys were approximately 60% the size of those of wildtype littermates, and the number of nephrons was strikingly re-

duced. Heterozygous mutant mice showed increased apoptotic cell death during fetal kidney development, but the increased apoptosis was not associated with random stochastic inactivation of Pax2 expression in mutant kidneys; Pax2 was shown to be biallelically expressed during kidney development. The findings supported the conclusion that heterozygous mutations of the PAX2 gene are associated with increased apoptosis and reduced branching of the ureteric bud, due to reduced PAX2 dosage during a critical window in kidney development.

[6061] It is appreciated that the abovementioned animal model for PAX2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6062] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6063] Sanyanusin, P.; Schimmenti, L. A.; McNoe, L. A.; Ward, T. A.; Pierpont, M. E. M.; Sullivan, M. J.; Dobyns, W. B.; Eccles, M. R. : Mutation of the PAX2 gene in a family with optic nerve colobomas, renal anomalies and vesicoureteral reflux. Nature Genet. 9: 358- 364, 1995. ; and

[6065] Further studies establishing the function and utilities of PAX2 are found in John Hopkins OMIM database record ID 167409, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired box gene 2 (PAX2, Accession NP_003979.1) is another GAM47 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:5547, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6066] Another function of GAM47 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_003979.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[6067] The function of PAX2 has been established by previous studies. Sanyanusin et al. (1996) obtained the complete genomic structure of the human PAX2 gene. They described 5 genomic lambda clones containing human PAX2 gene sequences, 4 of which had previously been reported by them (Sanyanusin et al., 1995). The fifth clone, which included exons 7 and 8, was obtained by Sanyanusin et al. (1996) from a subgenomic lambda cDNA library of size-fractionated EcoRI fragments ranging in size from 6 to 8 kb. Sequencing and restriction mapping of these clones showed that the human PAX2 gene is composed of 12 exons spanning approximately 70 kb. They also found 2 alternatively spliced exons corresponding to exon 10 (Ward et al., 1994) and a 69- bp inserted sequence that they designated as exon 6. The 69- bp insert is homologous to a 69- bp insert reported in the murine Pax2 gene by Dressler et al. (1990). Sanyanusin et al. (1996) identified a (CA)n dinucleotide repeat polymorphism in PAX2 which they mapped immediately upstream of exon 9. The PAX2 gene is expressed in primitive cells of the kidney, ureter, eye, ear, and central nervous system. Based on the known expression pattern of PAX2, Sanyanusin et al. (1995) predicted that the phenotype caused by mutations of PAX2

would probably consist of autosomal dominant eye malformations, sensorineural hearing loss, and renal hypoplasia. Pursuing this suspicion, they found deletion of a single nucleotide in exon 5 of the PAX2 gene (167409.0001) in a father and 3 of his 5 sons who had optic nerve colobomas, renal hypoplasia, mild proteinuria, and vesicoureteral reflux. The nucleotide deletion caused a frameshift in the conserved octapeptide sequence. The phenotype was similar to that of Krd mutant mice which lack a portion of chromosome 19 that is homologous to human 10q24 and includes the Pax2 gene. These mice have reduced thickness of the renal cortex, a reduced number of glomeruli at birth, and reduced amplitudes on electroretinogram. In the Krd mouse, the deletion of chromosome 19 was transgene- induced (Keller et al., 1994). Coloboma of the optic nerve with renal disease (OMIM Ref. No. 120330) is a recognized syndrome. Renal dysplasia and retinal aplasia are combined in the Loken- Senior syndrome (OMIM Ref. No. 266900). Ocular abnormalities occur also with familial juvenile nephronophthisis (OMIM Ref. No. 256100), but that disorder maps to chromosome 2.

[6068] Animal model experiments lend further support to the

function of PAX2. To determine the direct effects of PAX2 mutations on kidney development, fetal kidneys of mice carrying a Pax2(1Neu) mutation were examined. At embryonic day 15 (E15), heterozygous mutant kidneys were approximately 60% the size of those of wildtype littermates, and the number of nephrons was strikingly reduced. Heterozygous mutant mice showed increased apoptotic cell death during fetal kidney development, but the increased apoptosis was not associated with random stochastic inactivation of Pax2 expression in mutant kidneys; Pax2 was shown to be biallelically expressed during kidney development. The findings supported the conclusion that heterozygous mutations of the PAX2 gene are associated with increased apoptosis and reduced branching of the ureteric bud, due to reduced PAX2 dosage during a critical window in kidney development.

[6069] It is appreciated that the abovementioned animal model for PAX2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6070] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6071] Sanyanusin, P.; Schimmenti, L. A.; McNoe, L. A.; Ward, T. A.; Pierpont, M. E. M.; Sullivan, M. J.; Dobyns, W. B.; Eccles, M. R. : Mutation of the PAX2 gene in a family with optic nerve colobomas, renal anomalies and vesicoureteral reflux. Nature Genet. 9: 358- 364, 1995. ; and

[6072] Porteous, S.; Torban, E.; Cho, N.- P.; Cunliffe, H.; Chua, L.; McNoe, L.; Ward, T.; Souza, C.; Gus, P.; Giugliani, R.; Sato, T.; Yun, K.; Favor, J.; Sicotte, M.; Goodyer, P.; Eccles, M.

[6073] Further studies establishing the function and utilities of PAX2 are found in John Hopkins OMIM database record ID 167409, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired box gene 2 (PAX2, Accession NP_003981.1) is another GAM47 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:5547, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6074] Another function of GAM47 is therefore inhibition of

Paired box gene 2 (PAX2, Accession NP_003981.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[6075] The function of PAX2 has been established by previous studies. Sanyanusin et al. (1996) obtained the complete genomic structure of the human PAX2 gene. They described 5 genomic lambda clones containing human PAX2 gene sequences, 4 of which had previously been reported by them (Sanyanusin et al., 1995). The fifth clone, which included exons 7 and 8, was obtained by Sanyanusin et al. (1996) from a subgenomic lambda cDNA library of size-fractionated EcoRI fragments ranging in size from 6 to 8 kb. Sequencing and restriction mapping of these clones showed that the human PAX2 gene is composed of 12 exons spanning approximately 70 kb. They also found 2 alternatively spliced exons corresponding to exon 10 (Ward et al., 1994) and a 69- bp inserted sequence that they designated as exon 6. The 69- bp insert is homologous to a 69- bp insert reported in the murine Pax2 gene by Dressler et al. (1990). Sanyanusin et al. (1996) identified a

(CA)n dinucleotide repeat polymorphism in PAX2 which they mapped immediately upstream of exon 9. The PAX2 gene is expressed in primitive cells of the kidney, ureter, eye, ear, and central nervous system. Based on the known expression pattern of PAX2, Sanyanusin et al. (1995) predicted that the phenotype caused by mutations of PAX2 would probably consist of autosomal dominant eye malformations, sensorineural hearing loss, and renal hypoplasia. Pursuing this suspicion, they found deletion of a single nucleotide in exon 5 of the PAX2 gene (167409.0001) in a father and 3 of his 5 sons who had optic nerve colobomas, renal hypoplasia, mild proteinuria, and vesicoureteral reflux. The nucleotide deletion caused a frameshift in the conserved octapeptide sequence. The phenotype was similar to that of Krd mutant mice which lack a portion of chromosome 19 that is homologous to human 10q24 and includes the Pax2 gene. These mice have reduced thickness of the renal cortex, a reduced number of glomeruli at birth, and reduced amplitudes on electroretinogram. In the Krd mouse, the deletion of chromosome 19 was transgene- induced (Keller et al., 1994). Coloboma of the optic nerve with renal disease (OMIM Ref. No. 120330) is a recognized syndrome. Renal dysplasia

and retinal aplasia are combined in the Loken- Senior syndrome (OMIM Ref. No. 266900). Ocular abnormalities occur also with familial juvenile nephronophthisis (OMIM Ref. No. 256100), but that disorder maps to chromosome 2.

[6076] Animal model experiments lend further support to the function of PAX2. To determine the direct effects of PAX2 mutations on kidney development, fetal kidneys of mice carrying a Pax2(1Neu) mutation were examined. At embryonic day 15 (E15), heterozygous mutant kidneys were approximately 60% the size of those of wildtype littermates, and the number of nephrons was strikingly reduced. Heterozygous mutant mice showed increased apoptotic cell death during fetal kidney development, but the increased apoptosis was not associated with random stochastic inactivation of Pax2 expression in mutant kidneys; Pax2 was shown to be biallelically expressed during kidney development. The findings supported the conclusion that heterozygous mutations of the PAX2 gene are associated with increased apoptosis and reduced branching of the ureteric bud, due to reduced PAX2 dosage during a critical window in kidney development.

[6077] It is appreciated that the abovementioned animal model

for PAX2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6078] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6079] Sanyanusin, P.; Schimmenti, L. A.; McNoe, L. A.; Ward, T. A.; Pierpont, M. E. M.; Sullivan, M. J.; Dobyns, W. B.; Eccles, M. R. : Mutation of the PAX2 gene in a family with optic nerve colobomas, renal anomalies and vesicoureteral reflux. Nature Genet. 9: 358- 364, 1995. ; and

[6081] Further studies establishing the function and utilities of PAX2 are found in John Hopkins OMIM database record ID 167409, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired box gene 2 (PAX2, Accession NP_003978.1) is another GAM47 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:5547, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6082] Another function of GAM47 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_003978.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[6083] The function of PAX2 has been established by previous studies. Sanyanusin et al. (1996) obtained the complete genomic structure of the human PAX2 gene. They described 5 genomic lambda clones containing human PAX2 gene sequences, 4 of which had previously been reported by them (Sanyanusin et al., 1995). The fifth clone, which included exons 7 and 8, was obtained by Sanyanusin et al. (1996) from a subgenomic lambda cDNA library of size-fractionated EcoRI fragments ranging in size from 6 to 8 kb. Sequencing and restriction mapping of these clones showed that the human PAX2 gene is composed of 12 ex-

ons spanning approximately 70 kb. They also found 2 alternatively spliced exons corresponding to exon 10 (Ward et al., 1994) and a 69- bp inserted sequence that they designated as exon 6. The 69- bp insert is homologous to a 69- bp insert reported in the murine Pax2 gene by Dressler et al. (1990). Sanyanusin et al. (1996) identified a (CA)n dinucleotide repeat polymorphism in PAX2 which they mapped immediately upstream of exon 9. The PAX2 gene is expressed in primitive cells of the kidney, ureter, eye, ear, and central nervous system. Based on the known expression pattern of PAX2, Sanyanusin et al. (1995) predicted that the phenotype caused by mutations of PAX2 would probably consist of autosomal dominant eye malformations, sensorineural hearing loss, and renal hypoplasia. Pursuing this suspicion, they found deletion of a single nucleotide in exon 5 of the PAX2 gene (167409.0001) in a father and 3 of his 5 sons who had optic nerve colobomas, renal hypoplasia, mild proteinuria, and vesicoureteral reflux. The nucleotide deletion caused a frameshift in the conserved octapeptide sequence. The phenotype was similar to that of Krd mutant mice which lack a portion of chromosome 19 that is homologous to human 10q24 and includes the Pax2 gene. These mice

have reduced thickness of the renal cortex, a reduced number of glomeruli at birth, and reduced amplitudes on electroretinogram. In the Krd mouse, the deletion of chromosome 19 was transgene- induced (Keller et al., 1994). Coloboma of the optic nerve with renal disease (OMIM Ref. No. 120330) is a recognized syndrome. Renal dysplasia and retinal aplasia are combined in the Loken- Senior syndrome (OMIM Ref. No. 266900). Ocular abnormalities occur also with familial juvenile nephronophthisis (OMIM Ref. No. 256100), but that disorder maps to chromosome 2.

[6084] Animal model experiments lend further support to the function of PAX2. To determine the direct effects of PAX2 mutations on kidney development, fetal kidneys of mice carrying a Pax2(1Neu) mutation were examined. At embryonic day 15 (E15), heterozygous mutant kidneys were approximately 60% the size of those of wildtype littermates, and the number of nephrons was strikingly reduced. Heterozygous mutant mice showed increased apoptotic cell death during fetal kidney development, but the increased apoptosis was not associated with random stochastic inactivation of Pax2 expression in mutant kidneys; Pax2 was shown to be biallelically expressed during

kidney development. The findings supported the conclusion that heterozygous mutations of the PAX2 gene are associated with increased apoptosis and reduced branching of the ureteric bud, due to reduced PAX2 dosage during a critical window in kidney development.

[6085] It is appreciated that the abovementioned animal model for PAX2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6086] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6087] Sanyanusin, P.; Schimmenti, L. A.; McNoe, L. A.; Ward, T. A.; Pierpont, M. E. M.; Sullivan, M. J.; Dobyns, W. B.; Eccles, M. R. : Mutation of the PAX2 gene in a family with optic nerve colobomas, renal anomalies and vesicoureteral reflux. Nature Genet. 9: 358- 364, 1995. ; and

[6088] Porteous, S.; Torban, E.; Cho, N.- P.; Cunliffe, H.; Chua, L.; McNoe, L.; Ward, T.; Souza, C.; Gus, P.; Giugliani, R.; Sato, T.; Yun, K.; Favor, J.; Sicotte, M.; Goodyer, P.; Eccles, M.

[6089] Further studies establishing the function and utilities of PAX2 are found in John Hopkins OMIM database record ID 167409, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Paired box gene 2 (PAX2, Accession NP_000269.1) is another GAM47 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:5547, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6090] Another function of GAM47 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_000269.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[6091] The function of PAX2 has been established by previous studies. Sanyanusin et al. (1996) obtained the complete genomic structure of the human PAX2 gene. They described 5 genomic lambda clones containing human PAX2 gene sequences, 4 of which had previously been reported

by them (Sanyanusin et al., 1995). The fifth clone, which included exons 7 and 8, was obtained by Sanyanusin et al. (1996) from a subgenomic lambda cDNA library of size-fractionated EcoRI fragments ranging in size from 6 to 8 kb. Sequencing and restriction mapping of these clones showed that the human PAX2 gene is composed of 12 exons spanning approximately 70 kb. They also found 2 alternatively spliced exons corresponding to exon 10 (Ward et al., 1994) and a 69- bp inserted sequence that they designated as exon 6. The 69- bp insert is homologous to a 69- bp insert reported in the murine Pax2 gene by Dressler et al. (1990). Sanyanusin et al. (1996) identified a (CA)n dinucleotide repeat polymorphism in PAX2 which they mapped immediately upstream of exon 9. The PAX2 gene is expressed in primitive cells of the kidney, ureter, eye, ear, and central nervous system. Based on the known expression pattern of PAX2, Sanyanusin et al. (1995) predicted that the phenotype caused by mutations of PAX2 would probably consist of autosomal dominant eye malformations, sensorineural hearing loss, and renal hypoplasia. Pursuing this suspicion, they found deletion of a single nucleotide in exon 5 of the PAX2 gene (167409.0001) in a father and 3 of his 5 sons who had

optic nerve colobomas, renal hypoplasia, mild proteinuria, and vesicoureteral reflux. The nucleotide deletion caused a frameshift in the conserved octapeptide sequence. The phenotype was similar to that of Krd mutant mice which lack a portion of chromosome 19 that is homologous to human 10q24 and includes the Pax2 gene. These mice have reduced thickness of the renal cortex, a reduced number of glomeruli at birth, and reduced amplitudes on electroretinogram. In the Krd mouse, the deletion of chromosome 19 was transgene- induced (Keller et al., 1994). Coloboma of the optic nerve with renal disease (OMIM Ref. No. 120330) is a recognized syndrome. Renal dysplasia and retinal aplasia are combined in the Loken- Senior syndrome (OMIM Ref. No. 266900). Ocular abnormalities occur also with familial juvenile nephronophthisis (OMIM Ref. No. 256100), but that disorder maps to chromosome 2.

[6092] Animal model experiments lend further support to the function of PAX2. To determine the direct effects of PAX2 mutations on kidney development, fetal kidneys of mice carrying a Pax2(1Neu) mutation were examined. At embryonic day 15 (E15), heterozygous mutant kidneys were approximately 60% the size of those of wildtype litter-

mates, and the number of nephrons was strikingly reduced. Heterozygous mutant mice showed increased apoptotic cell death during fetal kidney development, but the increased apoptosis was not associated with random stochastic inactivation of Pax2 expression in mutant kidneys; Pax2 was shown to be biallelically expressed during kidney development. The findings supported the conclusion that heterozygous mutations of the PAX2 gene are associated with increased apoptosis and reduced branching of the ureteric bud, due to reduced PAX2 dosage during a critical window in kidney development.

[6093] It is appreciated that the abovementioned animal model for PAX2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6094] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6095] Sanyanusin, P.; Schimmenti, L. A.; McNoe, L. A.; Ward, T. A.; Pierpont, M. E. M.; Sullivan, M. J.; Dobyns, W. B.; Eccles, M. R. : Mutation of the PAX2 gene in a family with optic nerve colobomas, renal anomalies and vesicoureteral reflux. Nature Genet. 9: 358- 364, 1995. ; and

[6096] Porteous, S.; Torban, E.; Cho, N.- P.; Cunliffe, H.; Chua, L.; McNoe, L.; Ward, T.; Souza, C.; Gus, P.; Giugliani, R.; Sato, T.; Yun, K.; Favor, J.; Sicotte, M.; Goodyer, P.; Eccles, M.

[6097] Further studies establishing the function and utilities of PAX2 are found in John Hopkins OMIM database record ID 167409, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pre-b-cell leukemia transcription factor 1 (PBX1, Accession NP_002576.1) is another GAM47 target gene, herein designated TARGET GENE. PBX1 BINDING SITE1 and PBX1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PBX1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PBX1 BINDING SITE1 and PBX1 BINDING SITE2, designated SEQ ID:8409 and SEQ ID:18068 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6098] Another function of GAM47 is therefore inhibition of Pre-b-cell leukemia transcription factor 1 (PBX1, Accession NP_002576.1), a gene which involves in steroidogenesis and subsequently sexual development and differentiation and therefore is associated with Pre- b- cell acute lym-

phoblastic leukemias. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Pre- b- cell acute lymphoblastic leukemias, and of other diseases and clinical conditions associated with PBX1.

[6099] The function of PBX1 has been established by previous studies. Kamps et al. (1991) discussed the chimeric genes created by the human t(1;19) translocation in pre- B- cell acute lymphoblastic leukemias. The authors cloned 2 different E2A- PBX1 fusion transcripts (which differed only in the PBX1 sequences they contained) and showed that NIH-3T3 cells transfected with cDNAs encoding the fusion proteins were able to cause malignant tumors in nude mice. They discussed subtle differences in the transforming ability of the 2 fusion proteins with respect to the regions of the PBX1 gene they contained.

[6100] Animal model experiments lend further support to the function of PBX1. In vitro studies have shown that PBX1 regulates the activity of IPF1, a Para- Hox homeodomain transcription factor required for the development and function of the pancreas in mice and humans. To investigate in vivo roles of PBX1 in pancreatic development and function, Kim et al. (2002) examined pancreatic Pbx1 expression, and morphogenesis, cell differentiation, and

function in mice deficient for Pbx1. Pbx1 - /- embryos had pancreatic hypoplasia and marked defects in exocrine and endocrine cell differentiation prior to death at embryonic day 15 or 16. In these embryos, expression of Isl1 (OMIM Ref. No. 600366) and Atoh5 (OMIM Ref. No. 604882), essential regulators of pancreatic morphogenesis and differentiation, was severely reduced. Pbx1 +/- adults had pancreatic islet malformations, impaired glucose tolerance, and hypoinsulinemia. Thus, Kim et al. (2002) concluded that PBX1 is essential for normal pancreatic development and function. Analysis of trans- heterozygous Pbx1 +/- and Ipf1 +/- mice revealed in vivo genetic interactions between Pbx1 and Ipf1 that are essential for postnatal pancreatic function. Trans- heterozygous mice developed age- dependent overt diabetes mellitus, unlike Pbx1 +/- or Ipf1 +/- mice. Mutations affecting the Ipf1 protein promote diabetes mellitus in mice and humans. Kim et al. (2002) concluded that perturbation of PBX1 activity may also promote susceptibility to diabetes mellitus.

[6101] It is appreciated that the abovementioned animal model for PBX1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[6102] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6103] Kamps, M. P.; Look, A. T.; Baltimore, D. : The human t(1:19) translocation in pre- B ALL produces multiple nuclear E2A- Pbx1 fusion proteins with differing transforming potentials. Genes Dev. 5: 358- 368, 1991. ; and

[6104] Kim, S. K.; Selleri, L.; Lee, J. S.; Zhang, A. Y.; Gu, X.; Jacobs, Y.; Cleary, M. L. : Pbx1 inactivation disrupts pancreas development and in Ipf1- deficient mice promotes diabetes mellit.

[6105] Further studies establishing the function and utilities of PBX1 are found in John Hopkins OMIM database record ID 176310, and in cited publications listed in Table 5, which are hereby incorporated by reference.Bh-protocadherin (brain-heart) (PCDH7, Accession NP_115833.1) is another GAM47 target gene, herein designated TARGET GENE. PCDH7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDH7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of PCDH7 BINDING SITE, designated SEQ ID:7631, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6106] Another function of GAM47 is therefore inhibition of Bh-protocadherin (brain-heart) (PCDH7, Accession NP_115833.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH7.

[6107] Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1) is another GAM47 target gene, herein designated TARGET GENE. PDE4B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PDE4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4B BINDING SITE, designated SEQ ID:19366, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6108] Another function of GAM47 is therefore inhibition of Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1), a gene which may be involved in mediating

central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti- inflammatory agents. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4B.

[6109] The function of PDE4B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Phosphodiesterase 4d interacting protein (myomegalin) (PDE4DIP, Accession NP_055459.1) is another GAM47 target gene, herein designated TARGET GENE. PDE4DIP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE4DIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:18790, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6110] Another function of GAM47 is therefore inhibition of Phosphodiesterase 4d interacting protein (myomegalin) (PDE4DIP, Accession NP_055459.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PDE4DIP.

[6111] PDZK3 (Accession NP_055837.2) is another GAM47 target gene, herein designated TARGET GENE. PDZK3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PDZK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZK3 BINDING SITE, designated SEQ ID:13259, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6112] Another function of GAM47 is therefore inhibition of PDZK3 (Accession NP_055837.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZK3.

[6113] PDZK3 (Accession NP_835260.1) is another GAM47 target gene, herein designated TARGET GENE. PDZK3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PDZK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZK3 BINDING SITE, designated

SEQ ID:13259, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6114] Another function of GAM47 is therefore inhibition of PDZK3 (Accession NP_835260.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZK3.

[6115] Phosphoprotein enriched in astrocytes 15 (PEA15, Accession NP_003759.1) is another GAM47 target gene, herein designated TARGET GENE. PEA15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PEA15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:5427, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6116] Another function of GAM47 is therefore inhibition of Phosphoprotein enriched in astrocytes 15 (PEA15, Accession NP_003759.1), a gene which is a phosphoprotein and involved in glucose uptake. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15.

[6117] The function of PEA15 has been established by previous

studies. Astrocytes are involved in a variety of functions, including storage of glycogen and support for the migration and differentiation of neurons. They express membrane receptors which allow them to respond to extracellular signals. Activation of the receptors induces a cascade of events, such as the stimulation of protein kinases and the subsequent phosphorylation of target proteins. Araujo et al. (1993) identified a unique 15- kD protein in astrocytes that exists as a nonphosphorylated form and as 2 increasingly phosphorylated varieties. This protein, which they called PEA15, contains a consensus site for protein kinase C (PKC; e.g., 176960) and is an endogenous substrate for PKC. Using differential display to identify genes whose expressions are altered in tissues derived from type II diabetes mellitus (OMIM Ref. No. 125853) patients compared with nondiabetic individuals, Condorelli et al. (1998) cloned cDNAs encoding PEA15, which they named PED for 'phosphoprotein enriched in diabetes'. The ubiquitously expressed 2.8- kb PED mRNA was overexpressed in fibroblasts, skeletal muscle, and adipose tissue from type II diabetics. Levels of the 15- kD PED phosphoprotein were also elevated in type II diabetic tissues. The authors demonstrated that transfection of a PED cDNA into differ-

entiating L6 skeletal muscle cells increases the content of glucose transporter- 1 (GLUT1; 138140) on the plasma membrane and inhibits insulin- stimulated glucose transport and cell surface recruitment of glucose transporter- 4 (GLUT4; 138190). These effects were reversed by blocking PKC activity.

[6118]

[6119] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6120] Araujo, H.; Danziger, N.; Cordier, J.; Glowinski, J.; Chneiweiss, H. : Characterization of PEA- 15, a major substrate for protein kinase C in astrocytes. J. Biol. Chem. 268: 5911- 5920, 1993. ; and

[6121] Condorelli, G.; Vigliotta, G.; Iavarone, C.; Caruso, M.; Tocchetti, C. G.; Andreozzi, F.; Cafieri, A.; Tecce, M. F.; Formisano, P.; Beguinot, L.; Beguinot, F. : PED/PEA- 15 gene controls.

[6122] Further studies establishing the function and utilities of PEA15 are found in John Hopkins OMIM database record ID 603434, and in cited publications listed in Table 5, which are hereby incorporated by reference.Peroxisome biogenesis factor 1 (PEX1, Accession NP_000457.1) is an-

other GAM47 target gene, herein designated TARGET GENE. PEX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PEX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEX1 BINDING SITE, designated SEQ ID:19226, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6123] Another function of GAM47 is therefore inhibition of Peroxisome biogenesis factor 1 (PEX1, Accession NP_000457.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX1.

[6124] 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 3 (PFKFB3, Accession NP_004557.1) is another GAM47 target gene, herein designated TARGET GENE. PFKFB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFKFB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFKFB3 BINDING SITE, designated SEQ ID:12032, to the nucleotide

sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6125] Another function of GAM47 is therefore inhibition of 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 3 (PFKFB3, Accession NP_004557.1), a gene which catalizes synthesis and degradation of fructose 2,6- bisphosphate. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFKFB3.

[6126] The function of PFKFB3 has been established by previous studies. The bifunctional 6- phosphofructo- 2- kinase (EC 2.7.1.105)/fructose- 2,6- bisphosphatase (EC 3.1.3.46) (PFKFB) regulates the steady- state concentration of fructose- 2,6- bisphosphate, a potent activator of a key regulatory enzyme of glycolysis, phosphofructokinase. Cancer cells maintain a high glycolytic rate even in the presence of oxygen, a phenomenon known as the Warburg effect (Warburg, 1956). The glycolytic rate in the placenta, another fast- growing tissue, is accelerated by anoxia and by maternal diabetes By screening a placental cDNA library with human and frog liver PFKFB (PFKFB1; 311790) as probes, Sakai et al. (1996) obtained a cDNA encoding PFKFB3, which they termed HP (human placental PFKFB).

The predicted PFKFB3 protein, which is 61% similar to human liver PFKFB, contains 529 amino acids and 7 potential phosphorylation sites. Northern blot analysis of first-trimester and term placentas detected a 4.5- kb PFKFB3 transcript

[6127]

[6128] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6129] Sakai, A.; Kato, M.; Fukasawa, M.; Ishiguro, M.; Furuya, E.; Sakakibara, R. : Cloning of cDNA encoding for a novel isozyme of fructose 6- phosphate,2- kinase/fructose 2,6-bisphosphatase from human placenta. J. Biochem. 119: 506- 511, 1996. ; and

[6130] Warburg, O. : On the origin of cancer cells. Science 123: 309- 314, 1956.

[6131] Further studies establishing the function and utilities of PFKFB3 are found in John Hopkins OMIM database record ID 605319, and in cited publications listed in Table 5, which are hereby incorporated by reference.6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NP_004558.1) is another GAM47 target gene, herein designated TARGET GENE. PFKFB4

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFKFB4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFKFB4 BINDING SITE, designated SEQ ID:14338, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6132] Another function of GAM47 is therefore inhibition of 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NP_004558.1), a gene which catalizes synthesis and degradation of fructose 2,6- bisphosphate. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFKFB4.

[6133] The function of PFKFB4 has been established by previous studies. The bifunctional 6- phosphofructo- 2- kinase (EC 2.7.1.105)/fructose- 2,6- bisphosphatase (EC 3.1.3.46) (PFKFB) regulates the steady- state concentration of fructose- 2,6- bisphosphate, a potent activator of a key regulatory enzyme of glycolysis, phosphofructokinase. Isozymes of PFKFB differ in the regions surrounding the catalytic core, which are important for the differential re-

sponse to allosteric effectors and hormonal signals in different tissues By screening a placental cDNA library with human and frog liver PFKFB (PFKFB1; 311790) as probes, Sakai et al. (1996) obtained a partial cDNA encoding PFKFB4, which they termed 2K- 1. Manzano et al. (1999) isolated a cDNA encoding PFKFB4 by screening a human testis cDNA library with a rat liver Pfkfb probe, followed by RT- PCR. The predicted 469- amino acid PFKFB4 protein, which is 97% homologous to the rat sequence and approximately 70% identical to the human PFKFB isoforms, contains multiple phosphorylation sites. Northern blot analysis of rat brain, heart, liver, muscle, placenta, adipose tissue, ovary, fallopian tubes, and testis with the human PFKFB4 sequence as probe detected testis- specific expression of 2.4- and 3.3- kb transcripts. Western blot analysis showed expression of a 55- kD protein, close to the predicted value.

[6134]

[6135] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6136] Sakai, A.; Kato, M.; Fukasawa, M.; Ishiguro, M.; Furuya, E.; Sakakibara, R. : Cloning of cDNA encoding for a novel isozyme of fructose 6- phosphate,2- kinase/fructose 2,6- bisphosphatase from human placenta. J. Biochem. 119: 506- 511, 1996. ; and

[6137] Manzano, A.; Perez, J. X.; Nadal, M.; Estivill, X.; Lange, A.; Bartrons, R. : Cloning, expression and chromosomal localization of a human testis 6- phosphofructo- 2- kinase/ fructose- 2,6- bis.

[6138] Further studies establishing the function and utilities of PFKFB4 are found in John Hopkins OMIM database record ID 605320, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pftaire protein kinase 1 (PFTK1, Accession NP_036527.1) is another GAM47 target gene, herein designated TARGET GENE. PFTK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFTK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of PFTK1 BINDING SITE, designated SEQ ID:10701, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6139] Another function of GAM47 is therefore inhibition of Pftaire protein kinase 1 (PFTK1, Accession NP_036527.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1.

[6140] PHGDHL1 (Accession NP_808882.1) is another GAM47 target gene, herein designated TARGET GENE. PHGDHL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PHGDHL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHGDHL1 BINDING SITE, designated SEQ ID:14585, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6141] Another function of GAM47 is therefore inhibition of PHGDHL1 (Accession NP_808882.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHGDHL1.

[6142] Phosphatidylinositol glycan, class b (PIGB, Accession

NP_004846.3) is another GAM47 target gene, herein designated TARGET GENE. PIGB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PIGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIGB BINDING SITE, designated SEQ ID:10347, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6143] Another function of GAM47 is therefore inhibition of Phosphatidylinositol glycan, class b (PIGB, Accession NP_004846.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGB.

[6144] PIP5K2C (Accession NP_079055.2) is another GAM47 target gene, herein designated TARGET GENE. PIP5K2C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIP5K2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K2C BINDING SITE, designated SEQ ID:10143, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA,

also designated SEQ ID:269.

[6145] Another function of GAM47 is therefore inhibition of PIP5K2C (Accession NP_079055.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2C.

[6146] Pleiomorphic adenoma gene 1 (PLAG1, Accession NP_002646.1) is another GAM47 target gene, herein designated TARGET GENE. PLAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:9631, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6147] Another function of GAM47 is therefore inhibition of Pleiomorphic adenoma gene 1 (PLAG1, Accession NP_002646.1), a gene which contains a zinc finger domain. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1.

[6148] The function of PLAG1 has been established by previous studies. Pleomorphic adenomas are benign epithelial tu-

mors originating from the major and minor salivary glands (see OMIM Ref. No. 181030). They are characterized by recurrent chromosome translocations; the most common abnormalities involve chromosome 8, with consistent breakpoints at band q12. Kas et al. (1997) described the construction of 2 nonoverlapping YAC contigs covering about 75% of human chromosome band 8q12, which spans approximately 9 Mb of genomic DNA and includes a number of known genes such as MOS (OMIM Ref. No. 190060) and LYN (OMIM Ref. No. 165120), as well as novel genes and expressed sequence tags (ESTs). By fluorescence in situ hybridization, the authors determined that the majority of pleomorphic adenoma 8q12 breakpoints clustered within a 2- Mb contig that was mapped to the centromeric region of 8q12 and that was covered by 34 overlapping YAC clones, and tagged by 31 markers with an average spacing of 65 kb. Nine of 11 primary adenomas with 8q12 abnormalities had breakpoints mapping within a 300- kb interval. By searching sequence databases with sequence tagged sites (STSs) located within the 300- kb region, Kas et al. (1997) identified an EST with sequence identity to one of the STSs. Northern blot analysis using this EST detected a 7.5- kb transcript

representing pleomorphic adenoma gene- 1 (PLAG1). The authors cloned human fetal kidney PLAG1 cDNAs and found that the PLAG1 gene contains 5 exons. Southern blot analysis of DNA from pleomorphic adenomas with t(3;8) detected rearrangements in the 5- prime noncoding region of the PLAG1 gene. Using 5- prime RACE or RT-PCR, the authors generated hybrid transcripts consisting of PLAG1 and beta- 1- catenin (CTNNB1; 116806) from every primary tumor analyzed. Northern blot analysis of 3 pleomorphic adenomas with t(3;8) and 1 adenoma with a variant t(8;15) revealed that PLAG1 expression was activated by the translocations in all 4 tumors. Kas et al. (1997) detected the 7.5- kb PLAG1 transcript in normal human fetal lung, fetal liver, and fetal kidney, but not in the corresponding adult tissues, adult salivary gland, or fetal brain; CTNNB1 appeared to be ubiquitously expressed. The deduced PLAG1 protein has 2 potential nuclear localization signals in the N- terminal region, 7 zinc finger domains, and a serine- rich C terminus. Astrom et al. (1999) found overexpression of PLAG1 in 23 of 47 primary benign and malignant pleomorphic adenomas of the salivary glands. In 5 adenomas with a normal karyotype, fusion transcripts were found in 3; PLAG1 and CTNNB1

were fused in 1 case, and in 2 others PLAG1 was fused with the gene encoding transcription elongation factor SII (OMIM Ref. No. 601425). The fusions occurred in the 5-prime noncoding region of PLAG1, leading to exchange of regulatory control elements and, as a consequence, activation of PLAG1 gene expression. Because all of the cases had grossly normal karyotypes, the rearrangements must result from cryptic rearrangements.

[6149]

[6150] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6151] Astrom, A.- K.; Voz, M. L.; Kas, K.; Roijer, E.; Wedell, B.; Mandahl, N.; Van de Ven, W.; Mark, J.; Stenman, G. : Conserved mechanism of PLAG1 activation in salivary gland tumors with and without chromosome 8q12 abnormalities: identification of SII as a new fusion partner gene. Cancer Res. 59: 918- 923, 1999. ; and

[6152] Kas, K.; Roijer, E.; Voz, M.; Meyen, E.; Stenman, G.; Van de Ven, W. J. M. : A 2- Mb YAC contig and physical map covering the chromosome 8q12 breakpoint cluster region in pleomorphic ad.

[6153] Further studies establishing the function and utilities of

PLAG1 are found in John Hopkins OMIM database record ID 603026, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phospholipase d1, phophatidylcholine-specific (PLD1, Accession NP_002653.1) is another GAM47 target gene, herein designated TARGET GENE. PLD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLD1 BINDING SITE, designated SEQ ID:5891, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6154] Another function of GAM47 is therefore inhibition of Phospholipase d1, phophatidylcholine-specific (PLD1, Accession NP_002653.1), a gene which is ADP ribosylation factor- activated phosphatidylcholine- specific phospholipase D1. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLD1.

[6155] The function of PLD1 has been established by previous studies. Phosphatidylcholine (PC)- specific phospholipases D (PLDs) catalyze the hydrolysis of PC to produce phos-

phatidic acid and choline. A range of agonists acting through G protein- coupled receptors and receptor tyrosine kinases stimulate this hydrolysis. PC- specific PLD activity has been implicated in numerous cellular pathways, including signal transduction, membrane trafficking, and the regulation of mitosis. Using primers specific for an EST that showed similarity to a yeast PC- specific PLD gene, Hammond et al. (1995) performed PCR on HeLa cDNA and then screened a HeLa cDNA library with the PCR product to clone a cDNA encoding PLD1. The 1,072-amino acid protein does not contain previously recognized domain structures and shows no similarity to PLC (see OMIM Ref. No. 600810) or PIGPLD (OMIM Ref. No. 602515). A database search identified homologs in numerous widely disparate organisms, demonstrating that PLD1 is a member of a novel but highly conserved gene family. Expression of PLD1 in insect cells produces a 120-kD protein, matching closely the theoretical size of 124 kD and suggesting that little if any posttranslational processing occurs. The authors showed that recombinant PLD1 activity is located both in the cytoplasm and in association with the membrane; they suggested that PLD1 can exist as a stable soluble protein and that controlled inter-

action with substrate- containing phospholipid surfaces may be a physiologically important mode of regulation. Hammond et al. (1995) demonstrated that PLD1 is stimulated by phosphatidylinositol 4,5- biphosphate and strongly inhibited by oleate in vitro. They found that ADP-ribosylation factor- 1 (ARF1; 103180) activates PLD1, suggesting that PLD1 is involved in intravesicular membrane trafficking. Hammond et al. (1997) identified an evolutionarily conserved splice variant of PLD1 that arises from regulated splicing of a 38- amino acid alternate exon. They found that both forms of PLD1 have identical catalytic and regulatory properties. The authors demonstrated that PLD1 can be activated in vitro by PKCA (OMIM Ref. No. 176960) and the monomeric GTP- binding proteins RHO A, RAC1 (OMIM Ref. No. 602048), and CDC42 (OMIM Ref. No. 116952). They suggested that PLD1 may be involved in cell morphology alterations as well as intracellular protein trafficking. By Northern blot analysis, Colley et al. (1997) detected mouse Pld1 expression in all tissues examined, with highest levels in kidney and lung. The ratio of Pld1 and Pld2 (OMIM Ref. No. 602384) in each tissue varied. In situ hybridization of mouse embryo and adult brain showed that Pld1 is expressed in a restricted

manner. By somatic cell hybrid analysis, Colley et al. (1997) mapped the human PLD1 gene to chromosome 3. By FISH, Park et al. (1998) refined the assignment to 3q26. By interspecific backcross analysis, Colley et al. (1997) mapped the mouse Pld1 gene to the proximal region of chromosome 3.

[6156]

[6157] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6158] Hammond, S. M.; Altshuller, Y. M.; Sung, T.- C.; Rudge, S. A.; Rose, K.; Engebrecht, J.; Morris, A. J.; Frohman, M. A. : Human ADP- ribosylation factor- activated phosphatidyl- choline- specific phospholipase D defines a new and highly conserved gene family. J. Biol. Chem. 270: 29640- 29643, 1995. ; and

[6160] Further studies establishing the function and utilities of PLD1 are found in John Hopkins OMIM database record ID 602382, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Protein o-fucosyltransferase 1 (POFUT1, Accession NP_056167.1) is another GAM47 target gene, herein designated TARGET GENE. POFUT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by POFUT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POFUT1 BINDING SITE, designated SEQ ID:18732, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6161] Another function of GAM47 is therefore inhibition of Protein o-fucosyltransferase 1 (POFUT1, Accession NP_056167.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POFUT1.

[6162] Pom121 membrane glycoprotein (rat) (POM121, Accession NP_742017.1) is another GAM47 target gene, herein designated TARGET GENE. POM121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POM121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POM121 BINDING SITE, designated SEQ ID:2631, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6163] Another function of GAM47 is therefore inhibition of Pom121 membrane glycoprotein (rat) (POM121, Accession NP_742017.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POM121.

[6164] Pou domain, class 4, transcription factor 2 (POU4F2, Accession NP_004566.1) is another GAM47 target gene, herein designated TARGET GENE. POU4F2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POU4F2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POU4F2 BINDING SITE, designated SEQ ID:12824, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6165] Another function of GAM47 is therefore inhibition of Pou domain, class 4, transcription factor 2 (POU4F2, Accession

NP_004566.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F2.

[6166] Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_680481.1) is another GAM47 target gene, herein designated TARGET GENE. PPIL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPIL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPIL2 BINDING SITE, designated SEQ ID:15498, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6167] Another function of GAM47 is therefore inhibition of Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_680481.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL2.

[6168] Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_680480.1) is another GAM47 target gene, herein designated TARGET GENE. PPIL2 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by PPIL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPIL2 BINDING SITE, designated SEQ ID:15498, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6169] Another function of GAM47 is therefore inhibition of Peptidylprolyl isomerase (cyclophilin)-like 2 (PPIL2, Accession NP_680480.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL2.

[6170] Protein phosphatase 1, regulatory (inhibitor) subunit 3b (PPP1R3B, Accession NP_078883.1) is another GAM47 target gene, herein designated TARGET GENE. PPP1R3B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:1614, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6171] Another function of GAM47 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 3b (PPP1R3B, Accession NP_078883.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B.

[6172] Prolactin regulatory element binding (PREB, Accession NP_037520.1) is another GAM47 target gene, herein designated TARGET GENE. PREB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PREB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PREB BINDING SITE, designated SEQ ID:9801, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6173] Another function of GAM47 is therefore inhibition of Prolactin regulatory element binding (PREB, Accession NP_037520.1), a gene which is a WD motif DNA- binding protein and involved in transcriptional regulation. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PREB.

[6174] The function of PREB has been established by previous

studies. Fliss et al. (1999) isolated a rat cDNA encoding Preb, a WD motif DNA- binding protein with the capacity to regulate prolactin (PRL; 176760) promoter activity. Northern blot analysis of human tissues using a rat Preb cDNA probe showed expression of a 2.2- kb transcript in heart, brain, placenta, liver, skeletal muscle, kidney, and pancreas; a 1.9- kb transcript in brain, placenta, and lung; and a 1.5- kb transcript heart, skeletal muscle, and pancreas. By screening a fetal brain cDNA library with a rat Preb probe, followed by 5- prime primer walking, Taylor Clelland et al. (2000) isolated a cDNA encoding human PREB. The deduced 417- amino acid protein, which is 89% identical to the rat protein, has 3 conserved WD repeats and 2 conserved pro- gln- rich regions. RNA dot blot analysis detected variable expression of PREB in all adult and fetal tissues. They proposed that PREB is a DNA-binding factor during mammalian development and that abnormal dosage may play a role in some of the phenotypic abnormalities observed in the partial trisomy 2p syndrome, which is characterized by a number of congenital defects, including genital abnormalities.

[6175]

[6176] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[6177] Fliss, M. S.; Hinkle, P. M.; Bancroft, C. : Expression cloning and characterization of PREB (prolactin regulatory element binding), a novel WD motif DNA- binding protein with a capacity to regulate prolactin promoter activity. Molec. Endocr. 13: 644- 657, 1999. ; and

[6178] Taylor Clelland, C. L.; Levy, B.; McKie, J. M.; Duncan, A. M. V.; Hirschhorn, K.; Bancroft, C. : Cloning and characterization of human PREB; a gene that maps to a genomic region associ.

[6179] Further studies establishing the function and utilities of PREB are found in John Hopkins OMIM database record ID 606395, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRICKLE2 (Accession XP_093799.2) is another GAM47 target gene, herein designated TARGET GENE. PRICKLE2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRICKLE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRICKLE2 BINDING SITE, designated SEQ ID:17660, to the nucleotide sequence of

GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6180] Another function of GAM47 is therefore inhibition of PRICKLE2 (Accession XP_093799.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRICKLE2.

[6181] Protein kinase, camp-dependent, catalytic, alpha (PRKACA, Accession NP_002721.1) is another GAM47 target gene, herein designated TARGET GENE. PRKACA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKACA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKACA BINDING SITE, designated SEQ ID:2912, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6182] Another function of GAM47 is therefore inhibition of Protein kinase, camp-dependent, catalytic, alpha (PRKACA, Accession NP_002721.1), a gene which phosphorylates target proteins on serine or threonine residues. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with PRKACA.

[6183] The function of PRKACA has been established by previous studies. Most of the effects of cAMP in the eukaryotic cell are mediated through the phosphorylation of target proteins on serine or threonine residues by the cAMP- dependent protein kinase (EC 2.7.1.37). The inactive cAMP-dependent protein kinase is a tetramer composed of 2 regulatory and 2 catalytic subunits. The cooperative binding of 4 molecules of cAMP dissociates the enzyme in a regulatory subunit dimer and 2 free active catalytic subunits. In the human, 4 different regulatory subunits (PRKAR1A, 188830; PRKAR1B, 176911; PRKAR2A, 176910; and PRKAR2B, 176912) and 3 catalytic subunits (PRKACA; PRKACB, 176892; and PRKACG 176893) have been identified. Using PCR and Southern blot analysis, Tasken et al. (1996) assigned the PRKACA gene to chromosome 19. By 2- color fluorescence in situ hybridization, they regionalized the assignment to 19p13.1.

[6184] Animal model experiments lend further support to the function of PRKACA. The intracellular second messenger cAMP affects cell physiology by directly interacting with effector molecules that include cyclic nucleotide- gated ion channels, cAMP- regulated G protein exchange fac-

tors, and cAMP- dependent protein kinases (PKA). Two catalytic subunits, C- alpha (OMIM Ref. No. PRKACA) and C- beta (OMIM Ref. No. PRKACB), are expressed in the mouse and mediate the effects of PKA. Skalhegg et al. (2002) generated a null mutation in the major catalytic subunit of PKA, C- alpha, and observed early postnatal lethality in the majority of C- alpha knockout mice. Surprisingly, a small percentage of C- alpha knockout mice, although runted, survived to adulthood. This growth retardation was not due to decreased GH (OMIM Ref. No. 139250) production but did correlate with a reduction in IGF1 (OMIM Ref. No. 147440) mRNA in the liver and diminished production of the major urinary proteins in kidney. In these animals, compensatory increases in C- beta levels occurred in brain whereas many tissues, including skeletal muscle, heart, and sperm, contained less than 10% of the normal PKA activity. Analysis of sperm in C- alpha knockout males revealed that spermatogenesis progressed normally but that mature sperm had defective forward motility

[6185] It is appreciated that the abovementioned animal model for PRKACA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further ap-

preciated from the publications sited hereinbelow.

[6186] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6187] Skalhegg, B. S.; Huang, Y.; Su, T.; Idzerda, R. L.; McKnight, G. S.; Burton, K. A. : Mutation of the C- alpha subunit of PKA leads to growth retardation and sperm dysfunction. Molec. Endocr. 16: 630- 639, 2002. ; and

[6188] Tasken, K.; Solberg, R.; Zhao, Y.; Hansson, V.; Jahnsen, T.; Siciliano, M. J. : The gene encoding the catalytic subunit C- alpha of cAMP- dependent protein kinase (locus PRKACA) localize.

[6189] Further studies establishing the function and utilities of PRKACA are found in John Hopkins OMIM database record ID 601639, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein kinase, camp-dependent, catalytic, gamma (PRKACG, Accession NP_002723.2) is another GAM47 target gene, herein designated TARGET GENE. PRKACG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKACG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of PRKACG BINDING SITE, designated SEQ ID:8827, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6190] Another function of GAM47 is therefore inhibition of Protein kinase, camp-dependent, catalytic, gamma (PRKACG, Accession NP_002723.2), a gene which is the catalytic subunit C gamma of cAMP- dependent protein kinase. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACG.

[6191] The function of PRKACG has been established by previous studies. Beebe et al. (1990) reported the molecular cloning of a third isoform of the catalytic subunit of cAMP- dependent protein kinase (C- alpha (PRKACA; 601639) and C- beta (PRKACB; 176892) had previously been characterized). The third form, isolated from a human testis cDNA library and designated C- gamma, was clearly derived from a gene distinct from C- alpha and C- beta and showed tissue- specific expression. Whereas at the amino acid level C- alpha and C- beta showed 93% homology, C- gamma showed only about 80% homology to both C- alpha and C- beta. Reinton et al. (1998) iso-

lated the entire human PRKACG genomic sequence. The PRKACG gene is intronless, contains remnants of a poly(A) tail, is flanked by direct repeats, and is colinear with the PRKACA gene. Thus, the authors concluded that the PRKACG gene is a PRKACA- derived retroposon. Northern blot analysis detected PRKACG expression in fractionated germ cells of human testes. Foss et al. (1991, 1992) mapped the gene for the subunit C- gamma to chromosome 9 by study of somatic cell hybrids. By in situ hybridization, they confirmed the assignment and regionalized the gene to 9q13.

[6192]

[6193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6194] Foss, K. B.; Simard, J.; Berube, D.; Beebe, S. J.; Sandberg, M.; Grzeschik, K.- H.; Gagne, R.; Hansson, V.; Jahnsen, T. : Localization of the catalytic subunit C- gamma of the cAMP- dependent protein kinase gene (PRKACG) to human chromosome region 9q13. Cytogenet. Cell Genet. 60: 22-25, 1992. ; and

[6195] Reinton, N.; Haugen, T. B.; Orstavik, S.; Skalhegg, B. S.; Hansson, V.; Jahnsen, T.; Tasken, K. : The gene encoding

the C gamma catalytic subunit of cAMP- dependent protein kinase is a tr.

[6196] Further studies establishing the function and utilities of PRKACG are found in John Hopkins OMIM database record ID 176893, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein kinase, camp-dependent, regulatory, type i, alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NP_002725.1) is another GAM47 target gene, herein designated TARGET GENE. PRKAR1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKAR1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKAR1A BINDING SITE, designated SEQ ID:15538, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6197] Another function of GAM47 is therefore inhibition of Protein kinase, camp-dependent, regulatory, type i, alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NP_002725.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PRKAR1A.

[6198] PRO2435 (Accession NP_060997.1) is another GAM47 target gene, herein designated TARGET GENE. PRO2435 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO2435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2435 BINDING SITE, designated SEQ ID:19591, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6199] Another function of GAM47 is therefore inhibition of PRO2435 (Accession NP_060997.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2435.

[6200] Protease, serine, 21 (testisin) (PRSS21, Accession NP_659206.1) is another GAM47 target gene, herein designated TARGET GENE. PRSS21 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRSS21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

PRSS21 BINDING SITE, designated SEQ ID:19855, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6201] Another function of GAM47 is therefore inhibition of Protease, serine, 21 (testisin) (PRSS21, Accession NP_659206.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSS21.

[6202] Protease, serine, 21 (testisin) (PRSS21, Accession NP_659205.1) is another GAM47 target gene, herein designated TARGET GENE. PRSS21 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRSS21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRSS21 BINDING SITE, designated SEQ ID:19855, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6203] Another function of GAM47 is therefore inhibition of Protease, serine, 21 (testisin) (PRSS21, Accession NP_659205.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PRSS21.

[6204] Protease, serine, 21 (testisin) (PRSS21, Accession NP_006790.1) is another GAM47 target gene, herein designated TARGET GENE. PRSS21 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRSS21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRSS21 BINDING SITE, designated SEQ ID:19855, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6205] Another function of GAM47 is therefore inhibition of Protease, serine, 21 (testisin) (PRSS21, Accession NP_006790.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSS21.

[6206] Pleckstrin homology, sec7 and coiled/coil domains 4 (PSCD4, Accession NP_037517.1) is another GAM47 target gene, herein designated TARGET GENE. PSCD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSCD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSCD4 BINDING SITE, designated SEQ ID:7145, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6207] Another function of GAM47 is therefore inhibition of Pleckstrin homology, sec7 and coiled/coil domains 4 (PSCD4, Accession NP_037517.1), a gene which promotes guanine- nucleotide exchange on arf1 and arf5. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSCD4.

[6208] The function of PSCD4 has been established by previous studies. ADP- ribosylation factors, or ARFS (see OMIM Ref. No. ARF1; 103180), are small GTP- binding proteins within the Ras superfamily that regulate vesicle trafficking in eukaryotic cells. ARF1 recruits coat proteins (e.g., COPA; 601924) to membranes on the cytoplasmic face of the Golgi apparatus. The PSCD proteins (e.g., PSCD1; 182115), a family of proteins containing a C- terminal pleckstrin homology (PH) domain and a central 200-amino acid region similar to a domain within the yeast Sec7 protein, which is required for vesicular traffic of

polypeptides through the Golgi, function as guanine- nucleotide exchange factors (GEFs) for ARFs. Klarlund et al. (1997) identified a cDNA encoding mouse Grp1 (general receptor for phosphoinositides- 1) by screening mouse adipocyte and brain cDNA expression libraries with phosphoinositide probes. By searching an EST database for sequences similar to mouse brain Grp1, followed by PCR and screening of a human blood cDNA library, Venkateswarlu et al. (1998) obtained a cDNA encoding PSCD3, which they called GRP1. Sequence analysis showed that the predicted 399- amino acid PSCD3 protein contains a 39- amino acid coiled- coil domain, a 172- amino acid Sec7 domain, and a 118- amino acid PH domain. PSCD3 shares 82.7% and 79.5% amino acid identity with PSCD1 and PSCD2 (OMIM Ref. No. 602488), respectively, as well as 98.8% identity with mouse Grp1. By Scatchard and mutational analyses, Venkateswarlu et al. (1998) determined that PSCD3 binds via its PH domain to the inositol head group of phosphatidylinositol 3,4,5- triphosphate with high affinity. Confocal laser microscopy demonstrated that stimulation of cells with either epidermal growth factor (EGF; 131530) or nerve growth factor (NGF; 162030) results in PH domain- dependent translocation of PSCD3 from the cytosol

to the plasma membrane. The translocation was rapid and transient with EGF, whereas NGF mediated a relatively longer translocation. By searching an EST database for Sec7 domain- related sequences and by screening a placenta cDNA library, Franco et al. (1998) isolated a cDNA encoding PSCD3, which they called ARNO3. Northern blot analysis revealed that PSCD3, in contrast to the ubiquitously expressed PSCD1 and PSCD2, is expressed as a 4.5- kb transcript that is almost absent from liver, thymus, and peripheral blood lymphocytes. Franco et al. (1998) found that PSCD3, like PSCD1 and PSCD2, shows GEF activity, mediated by the Sec7 domain, towards ARF1 but not ARF6 (OMIM Ref. No. 600464). Immunofluorescence microscopy indicated that overexpression of PSCD3 induces major morphologic alterations of the Golgi apparatus, including redistribution of Golgi resident proteins and the coat protein COPB (OMIM Ref. No. 600959). Lietzke et al. (2000) and Ferguson et al. (2000) determined the structure of the GRP1 PH domain in the unliganded form and bound to inositol 1,3,4,5- tetraphosphate. Lietzke et al. (2000) found that a novel mode of phosphoinositide recognition involving a 20- residue insertion within the beta- 6/beta- 7 loop explains the unusually

high specificity of the GRP1 PH domain and the promiscuous 3- phosphoinositide binding typical of several other PH domains, including that of protein kinase B (AKT1; 164730). By comparing the GRP1 PH domain to other PH domains, general determinants of 3- phosphoinositide recognition and specificity could be deduced.

[6209]

[6210] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6211] Ferguson, K. M.; Kavran, J. M.; Sankaran, V. G.; Fournier, E.; Isakoff, S. J.; Skolnik, E. Y.; Lemmon, M. A. : Structural basis for discrimination of 3- phosphoinositides by pleckstrin homology domains. Molec. Cell 6: 373- 384, 2000. ; and

[6212] Franco, M.; Boretto, J.; Robineau, S.; Monier, S.; Goud, B.; Chardin, P.; Chavrier, P. : ARNO3, a Sec7- domain guanine nucleotide exchange factor for ADP ribosylation factor 1, is invol.

[6213] Further studies establishing the function and utilities of PSCD4 are found in John Hopkins OMIM database record ID 606514, and in cited publications listed in Table 5, which are hereby incorporated by reference.Presenilin 1

(alzheimer disease 3) (PSEN1, Accession NP_015557.1) is another GAM47 target gene, herein designated TARGET GENE. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSEN1 BINDING SITE, designated SEQ ID:10827, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6214] Another function of GAM47 is therefore inhibition of Presenilin 1 (alzheimer disease 3) (PSEN1, Accession NP_015557.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN1.

[6215] Presenilin 1 (alzheimer disease 3) (PSEN1, Accession NP_000012.1) is another GAM47 target gene, herein designated TARGET GENE. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of PSEN1 BINDING SITE, designated SEQ ID:10827, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6216] Another function of GAM47 is therefore inhibition of Presenilin 1 (alzheimer disease 3) (PSEN1, Accession NP_000012.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN1.

[6217] PTCRA (Accession NP_612153.1) is another GAM47 target gene, herein designated TARGET GENE. PTCRA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PTCRA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTCRA BINDING SITE, designated SEQ ID:10565, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6218] Another function of GAM47 is therefore inhibition of PTCRA (Accession NP_612153.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTCRA.

[6219] Parathyroid hormone-like hormone (PTHLH, Accession NP_002811.1) is another GAM47 target gene, herein designated TARGET GENE. PTHLH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTHLH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTHLH BINDING SITE, designated SEQ ID:2062, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6220] Another function of GAM47 is therefore inhibition of Parathyroid hormone-like hormone (PTHLH, Accession NP_002811.1), a gene which plays a physiological role in lactation, possibly as a hormone for the mobilization and/or transfer of calcium to the milk. and therefore is associated with Humoral hypercalcemia of malignancy. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Humoral hypercalcemia of malignancy., and of other diseases and clinical conditions associated with PTHLH.

[6221] The function of PTHLH has been established by previous studies. PTHRP is responsible for most cases of humoral hypercalcemia of malignancy. It mimics the actions of PTH

because of its structural homology with PTH and its ability to bind to and signal via the PTH/PTHRP receptor in bone and kidney. PTHRP- (1- 36) appears to be one of several secretory forms of PTHRP. When this peptide was given intravenously (iv) to normal volunteers, it produced the same effects as PTH- (1- 34). To determine whether PTHRP- (1- 36) could be used subcutaneously (sc) in humans as a diagnostic reagent to study differences between HHM and hyperparathyroidism, Henry et al. (1997) examined whether sc PTHRP- (1- 36) could affect mineral homeostasis. PTHRP- (1- 36) given sc produced increases in circulating PTHRP- (1- 36), reductions in serum phosphorus and the renal phosphorus threshold, increments in fractional calcium excretion and nephrogenous cAMP excretion, and increases in plasma 1,25- dihydroxyvitamin D. The authors concluded that it is feasible to use PTHRP- (1- 36) in studies of HHM and hyperparathyroidism.

[6222] Animal model experiments lend further support to the function of PTHLH. Philbrick et al. (1998) found that whereas PTHRP knockout mice die at birth with a chondrodystrophic phenotype, replacement of PTHRP expression in the chondrocytes of these knockout mice using a procollagen II- driven transgene resulted in the correction

of the lethal skeletal abnormalities and generated animals that were effectively PTHRP- null in all sites other than cartilage. These rescued PTHRP knockout mice survived to at least 6 months of age but were small in stature and displayed a number of developmental defects, including cranial chondrodystrophy and a failure of tooth eruption. Teeth appeared to develop normally but became trapped by the surrounding bone and underwent progressive impaction. Localization of PTHRP mRNA during normal tooth development by in situ hybridization showed increasing levels of expression in the enamel epithelium before the formation of the eruption pathway. The type 1 PTH/PTHRP receptor is expressed in both the adjacent dental mesenchyme and in alveolar bone. The replacement of PTHRP expression in the enamel epithelium with a keratin 14-driven transgene corrected the defect in bone resorption and restored the normal program of tooth eruption. PTHRP therefore represents an essential signal in the formation of the eruption pathway.

[6223] It is appreciated that the abovementioned animal model for PTHLH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6224] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6225] Philbrick, W. M.; Dreyer, B. E.; Nakchbandi, I. A.; Karaplis, A. C. : Parathyroid hormone- related protein is required for tooth eruption. Proc. Nat. Acad. Sci. 95: 11846-11851, 1998. ; and

[6226] Strewler, G. J. : The physiology of parathyroid hormone-related protein. New Eng. J. Med. 342: 177- 185, 2000.

[6227] Further studies establishing the function and utilities of PTHLH are found in John Hopkins OMIM database record ID 168470, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein tyrosine phosphatase type iva, member 3 (PTP4A3, Accession NP_116000.1) is another GAM47 target gene, herein designated TARGET GENE. PTP4A3 BINDING SITE1 and PTP4A3 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PTP4A3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTP4A3 BINDING SITE1 and PTP4A3 BINDING SITE2, designated SEQ ID:12368 and SEQ

ID:16927 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6228] Another function of GAM47 is therefore inhibition of Protein tyrosine phosphatase type iva, member 3 (PTP4A3, Accession NP_116000.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A3.

[6229] Protein tyrosine phosphatase type iva, member 3 (PTP4A3, Accession NP_009010.2) is another GAM47 target gene, herein designated TARGET GENE. PTP4A3 BINDING SITE1 and PTP4A3 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PTP4A3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTP4A3 BINDING SITE1 and PTP4A3 BINDING SITE2, designated SEQ ID:16927 and SEQ ID:12368 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6230] Another function of GAM47 is therefore inhibition of Protein tyrosine phosphatase type iva, member 3 (PTP4A3,

Accession NP_009010.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A3.

[6231] Poliovirus receptor (PVR, Accession NP_006496.2) is another GAM47 target gene, herein designated TARGET GENE. PVR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PVR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PVR BINDING SITE, designated SEQ ID:12007, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6232] Another function of GAM47 is therefore inhibition of Poliovirus receptor (PVR, Accession NP_006496.2), a gene which is a poliovirus receptor and therefore may be associated with Poliomyelitis. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Poliomyelitis, and of other diseases and clinical conditions associated with PVR.

[6233] The function of PVR has been established by previous studies. Primates are susceptible to poliomyelitis infection, but rodents are not; furthermore, human cells but

not rodent cells are killed by poliovirus in vitro. Susceptibility to poliovirus is a function of the presence or absence of a cellular receptor to which the virus binds as the first step in poliovirus replication. Mendelsohn et al. (1986) succeeded in transforming a human poliovirus receptor gene into mouse L cells which are ordinarily resistant to poliovirus infection because they do not bear a poliovirus receptor. Monoclonal antibody directed against the HeLa cell poliovirus receptor site was used in rosette assays to identify poliovirus- sensitive transformants. In a study of human- mouse hybrids, Miller et al. (1974) showed that chromosome 19 is correlated with susceptibility to poliovirus. Siddique et al. (1985) regionalized the PVS gene to 19q13- qter. By the study of rodent/human hybrid cell lines carrying 4 different regions of human chromosome 19, Siddique et al. (1988) demonstrated that the typical cytopathic effects of poliovirus infection were observed only when the region 19q12- q13.2 was contained as the smallest region of overlap. The same region contains the gene for myotonic dystrophy (OMIM Ref. No. 160900). The PVS gene is also of interest in connection with inherited motor neuron diseases because it encodes a cell- surface receptor expressed on motor neurons.

Shepley et al. (1988) prepared a monoclonal antibody that identified a 100- kD membrane protein in HeLa cells and in human spinal cord involved in poliovirus attachment. They showed that the antigen identified by the monoclonal antibody was associated with the presence of human chromosome 19 in human- mouse hybrid cell lines. The monoclonal antibodies stained neurons in the reticular formation and clusters of brain stem neurons, consistent with the known pattern of damage caused by poliovirus infection in the brain stem. Furthermore, it reacted with human peripheral mononuclear cells, consistent with the known replication of poliovirus in Peyer patches and tonsils. Schonk et al. (1990) assigned the PVS gene to 19q13.2 by hybridization studies using a panel of somatic cell hybrids with subchromosomal segments of 19q. By fluorescence in situ hybridization, Trask et al. (1993) assigned the PVS gene to 19q13.2- q13.3. Seldin et al. (1991) mapped the homologous gene in the mouse to chromosome 9.

[6234]

[6238] Further studies establishing the function and utilities of PVR are found in John Hopkins OMIM database record ID 173850, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paxillin (PXN, Accession NP_002850.1) is another GAM47 target gene, herein designated TARGET GENE. PXN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PXN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PXN BINDING SITE, designated SEQ ID:11342, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6239] Another function of GAM47 is therefore inhibition of Paxillin (PXN, Accession NP_002850.1), a gene which may be

involved in p53- dependent apoptosis and therefore may be associated with Cancer. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Cancer, and of other diseases and clinical conditions associated with PXN.

[6240] The function of PXN has been established by previous studies. Drosophila peroxidasin is an extracellular matrix-associated peroxidase. It is expressed exclusively in hemocytes derived from head mesoderm at a very early stage of differentiation. Peroxidasin exists as a homotrimer with a unique hybrid structure that combines an enzymatically functional peroxidase domain with motifs that are typically found in extracellular matrix- associated proteins. It is a secreted protein that contains a secretory recognition sequence at its N terminus. Peroxidasin catalyzes hydrogen peroxide- driven radioiodination, oxidations, and the formation of dityrosine in vitro. It is also thought to function in extracellular matrix consolidation, phagocytosis, and defense. By sequencing random cDNAs corresponding to relatively long transcripts from the human immature myeloid cell line KG- 1, Nagase et al. (1996) identified a cDNA, which they called KIAA0230, that encodes PRG2. The cDNA represents at least 90% of

the full- length PRG2 transcript; however, since it lacks an inframe stop codon upstream of the first ATG, it may be missing 5- prime coding sequence. The 1,496- amino acid PRG2 protein deduced from the cDNA sequence contains predicted transmembrane domains. PRG2 shares 38% amino acid sequence identity with Drosophila peroxidasin across 1,412 amino acids. Northern blot analysis of human tissues showed PRG2 expression at higher levels in heart, lung, ovary, and placenta, and lower levels in liver, small intestine, colon, pancreas, spleen, kidney, thymus, skeletal muscle, testis, and prostate; PRG2 expression was not detected in brain or peripheral blood leukocytes.

[6241]

[6242] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6243] Horikoshi, N.; Cong, J.; Kley, N.; Shenk, T. : Isolation of differentially expressed cDNAs from p53- dependent apoptotic cells: activation of the human homologue of the Drosophila peroxidasin gene. Biochem. Biophys. Res. Commun. 261: 864- 869, 1999. ; and

[6244] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; No-

mura, N. : Prediction of the coding sequences of unidentified human g.

[6245] Further studies establishing the function and utilities of PXN are found in John Hopkins OMIM database record ID 602505, and in cited publications listed in Table 5, which are hereby incorporated by reference.RA-GEF-2 (Accession NP_057424.1) is another GAM47 target gene, herein designated TARGET GENE. RA-GEF-2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RA-GEF-2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:16978, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6246] Another function of GAM47 is therefore inhibition of RA-GEF-2 (Accession NP_057424.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2.

[6247] Ran binding protein 3 (RANBP3, Accession NP_015560.1) is another GAM47 target gene, herein designated TARGET

GENE. RANBP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RANBP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RANBP3 BINDING SITE, designated SEQ ID:1057, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6248] Another function of GAM47 is therefore inhibition of Ran binding protein 3 (RANBP3, Accession NP_015560.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP3.

[6249] Rna binding motif protein 8a (RBM8A, Accession NP_005096.1) is another GAM47 target gene, herein designated TARGET GENE. RBM8A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBM8A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:6484, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[6250] Another function of GAM47 is therefore inhibition of Rna binding motif protein 8a (RBM8A, Accession NP_005096.1), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM8A.

[6251] The function of RBM8A has been established by previous studies. Mago nashi (MAGOH; 602603), meaning grandchildless, is the homolog of a Drosophila protein required for normal germ plasm development in fly embryos. By performing a yeast 2- hybrid screen on a fetal brain cDNA library with MAGOH as the bait, Zhao et al. (2000) recovered a cDNA encoding RBM8. The 173- amino acid RBM8 protein is more than 93% identical to the mouse and zebrafish sequences, and the mouse differences are all accounted for by an 11- amino acid N- terminal insertion and another single- residue insertion in the mouse sequence. Exchange partner and GST pull- down assays confirmed the MAGOH- RBM8 interaction and showed that RBM8 is expressed as a 26- kD protein, slightly larger

than the predicted mass of 23 kD. Northern blot analysis detected a major RBM8 transcript of less than 1.0 kb in all tissues tested, with weakest expression in pancreas and brain. By searching an EST database for homologs of the gonadotropin- releasing hormone receptor (GNRHR; 138850), followed by 5- prime RACE on a skeletal muscle cDNA library, Conklin et al. (2000) identified a cDNA encoding RBM8. Northern blot analysis detected a major 0.9- kb transcript in all tissues tested. Sequence analysis of the 174- amino acid protein predicted an RNA- binding domain, which is composed of 2 amphipathic alpha helices packed against a 4- stranded beta sheet, and a C-terminal arg- rich segment.

[6252]

[6253] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6254] Conklin, D. C.; Rixon, M. W.; Kuestner, R. E.; Maurer, M. F.; Whitmore, T. E.; Millar, R. P. : Cloning and gene expression of a novel human ribonucleoprotein. Biochim. Biophys. Acta 1492: 465- 469, 2000. ; and

[6255] Zhao, X.- F.; Nowak, N. J.; Shows, T. B.; Aplan, P. D. : MAGOH interacts with a novel RNA- binding protein. Ge-

nomics 63: 145- 148, 2000.

[6256] Further studies establishing the function and utilities of RBM8A are found in John Hopkins OMIM database record ID 605313, and in cited publications listed in Table 5, which are hereby incorporated by reference.Arginine-glutamic acid dipeptide (re) repeats (RERE, Accession NP_036234.2) is another GAM47 target gene, herein designated TARGET GENE. RERE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RERE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:12774, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6257] Another function of GAM47 is therefore inhibition of Arginine-glutamic acid dipeptide (re) repeats (RERE, Accession NP_036234.2), a gene which binds DRPLA and locates in the nucleus and therefore may be associated with Dentatorubral- pallidoluysian atrophy. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Dentatorubral- pallidoluysian atrophy, and of other dis-

eases and clinical conditions associated with RERE.

[6258] The function of RERE has been established by previous studies. Northern blot analysis detected 2 RERE transcripts: one of 9 kb, expressed exclusively in pancreas and testis; and one of 7 kb, expressed most strongly in skeletal muscle with weaker expression in other tissues tested, including brain. The RERE protein migrated at an apparent molecular weight of 212 kD in SDS- PAGE. An RERE fusion protein localized predominantly in the nucleus. Immunoprecipitation and in vitro binding assays demonstrated that the DRPLA and RERE proteins bind each other, which is facilitated by one of the RE repeats, and that extension of the DRPLA polyglutamine tract enhances the binding. Moreover, when RERE is overexpressed, the distribution of endogenous DRPLA protein alters from a diffuse to a speckled pattern in the nucleus so as to colocalize with RERE. More RERE protein is recruited into nuclear aggregates of the DRPLA protein with extended polyglutamine than into those of pure polyglutamine. The authors suggested a function for the DRPLA protein in the nucleus and the RE repeat in the protein- protein interaction. By study of a YAC spanning a translocation/duplication breakpoint within the minimally defined loss of het-

erozygosity region at 1p36.2- p36.1 in a neuroblastoma cell line, Amler et al. (2000) identified the RERE gene, which they designated DNB1/ARP (deleted in neuroblastoma- 1/atrophin- related protein).

[6259]

[6260] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6261] Amler, L. C.; Bauer, A.; Corvi, R.; Dihlmann, S.; Praml, C.; Cavenee, W. K.; Schwab, M.; Hampton, G. M. : Identification and characterization of novel genes located at the t(1;15)(p36.2;q24) translocation breakpoint in the neuroblastoma cell line NGP. Genomics 64: 195- 202, 2000. ; and

[6262] Yanagisawa, H.; Bundo, M.; Miyashita, T.; Okamura- Oho, Y.; Tadokoro, K.; Tokunaga, K.; Yamada, M. : Protein binding of a DRPLA family through arginine- glutamic acid dipeptide repeats is.

[6263] Further studies establishing the function and utilities of RERE are found in John Hopkins OMIM database record ID 605226, and in cited publications listed in Table 5, which are hereby incorporated by reference.Re1-silencing transcription factor (REST, Accession NP_005603.2) is another

GAM47 target gene, herein designated TARGET GENE. REST BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by REST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of REST BINDING SITE, designated SEQ ID:13891, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6264] Another function of GAM47 is therefore inhibition of Re1-silencing transcription factor (REST, Accession NP_005603.2), a gene which may function as a master negative- regulator of neurogenesis. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REST.

[6265] The function of REST has been established by previous studies. Palm et al. (1999) identified several REST variants that arise from alternative splicing of an exon that they designated exon N. The splice variants produce insertions that generate in- frame stop codons and encode truncated proteins with an N- terminal repressor domain and weakened DNA- binding activity. The expression levels of these variants differ in human neuroblastoma and glial

cells.

[6266] Animal model experiments lend further support to the function of REST. Chen et al. (1998) disrupted the Rest gene in mice by gene targeting in mouse embryonic stem cells. As a result, derepression of neuron- specific tubulin (OMIM Ref. No. 602529) in a subset of nonneural tissues resulted and embryonic lethality ensued.

[6267] It is appreciated that the abovementioned animal model for REST is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6268] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6269] Palm, K.; Metsis, M.; Timmusk, T. : Neuron- specific splicing of zinc finger transcription factor REST/NRSF/XBR is frequent in neuroblastomas and conserved in human, mouse and rat. Molec. Brain Res. 72: 30- 39, 1999. ; and

[6270] Chen, Z.- F.; Paquette, A. J.; Anderson, D. J. : NRSF/REST is required in vivo for repression of multiple neuronal target genes during embryogenesis. Nature Genet. 20: 136- 142, 1998.

[6271] Further studies establishing the function and utilities of

REST are found in John Hopkins OMIM database record ID 600571, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ret proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, hirschsprung disease) (RET, Accession NP_065681.1) is another GAM47 target gene, herein designated TARGET GENE. RET BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RET, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE, designated SEQ ID:12696, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6272] Another function of GAM47 is therefore inhibition of Ret proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, hirschsprung disease) (RET, Accession NP_065681.1), a gene which transduces signals for cell growth and differentiation. and therefore may be associated with Multiple endocrine neoplasia. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Multiple endocrine neoplasia, and of

other diseases and clinical conditions associated with RET.

[6273] The function of RET has been established by previous studies. Using the approach of SSCP analysis established for all 20 exons of the RET gene, Seri et al. (1997) identified 7 additional mutations among 39 sporadic and familial cases of Hirschsprung disease (detection rate 18%). They considered that the relatively low efficiency of detecting mutations of RET in Hirschsprung patients cannot be accounted for by genetic heterogeneity, which is not supported by the results of linkage analysis in pedigrees analyzed to date. Almost 74% of the point mutations in their series, as well as in other patient series, were identified among long- segment patients, who represented only 25% of the patient population. Seri et al. (1997) found a C620R substitution in a patient affected with total colonic aganglionosis; the same mutation had been found in medullary thyroid carcinoma. An R313Q mutation (164761.0026) was identified in homozygous state in a child born of consanguineous parents and was associated with the most severe Hirschsprung phenotype, namely, a total colonic aganglionosis with small bowel involvement. Eng (1996) reviewed the role of the RET protooncogene in multiple endocrine neoplasia type II and in Hirschsprung

disease. Hoppener and Lips (1996) also reviewed RET gene mutations from the point of view of the molecular biology and the clinical aspects. Eng and Mulligan (1997) tabulated mutations of the RET gene in MEN2, the related sporadic tumors medullary thyroid carcinoma and pheochromocytoma, and familial and sporadic Hirschsprung disease. Germline mutations in 1 of 8 codons within RET cause the 3 subtypes of MEN2, namely, MEN2A, MEN2B, and familial medullary thyroid carcinoma. They stated that a somatic M918T mutation (164761.0013) accounts for the largest proportion of RET mutations detected in medullary thyroid carcinomas, most series showing a 30% to 50% range. It appeared that pheochromocytomas have a wider range of RET mutations. In contrast to MEN2, approximately 25% of patients with Hirschsprung disease have germline mutations scattered throughout the length of RET.

[6274]

[6275] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6285] Further studies establishing the function and utilities of RET are found in John Hopkins OMIM database record ID 164761, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ret proto-oncogene

(multiple endocrine neoplasia and medullary thyroid carcinoma 1, hirschsprung disease) (RET, Accession NP_066124.1) is another GAM47 target gene, herein designated TARGET GENE. RET BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RET, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE, designated SEQ ID:12696, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6286] Another function of GAM47 is therefore inhibition of Ret proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, hirschsprung disease) (RET, Accession NP_066124.1), a gene which transduces signals for cell growth and differentiation. and therefore may be associated with Multiple endocrine neoplasia. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Multiple endocrine neoplasia, and of other diseases and clinical conditions associated with RET.

[6287] The function of RET has been established by previous studies. Using the approach of SSCP analysis established

for all 20 exons of the RET gene, Seri et al. (1997) identified 7 additional mutations among 39 sporadic and familial cases of Hirschsprung disease (detection rate 18%). They considered that the relatively low efficiency of detecting mutations of RET in Hirschsprung patients cannot be accounted for by genetic heterogeneity, which is not supported by the results of linkage analysis in pedigrees analyzed to date. Almost 74% of the point mutations in their series, as well as in other patient series, were identified among long- segment patients, who represented only 25% of the patient population. Seri et al. (1997) found a C620R substitution in a patient affected with total colonic aganglionosis; the same mutation had been found in medullary thyroid carcinoma. An R313Q mutation (164761.0026) was identified in homozygous state in a child born of consanguineous parents and was associated with the most severe Hirschsprung phenotype, namely, a total colonic aganglionosis with small bowel involvement. Eng (1996) reviewed the role of the RET protooncogene in multiple endocrine neoplasia type II and in Hirschsprung disease. Hoppener and Lips (1996) also reviewed RET gene mutations from the point of view of the molecular biology and the clinical aspects. Eng and Mulligan (1997)

tabulated mutations of the RET gene in MEN2, the related sporadic tumors medullary thyroid carcinoma and pheochromocytoma, and familial and sporadic Hirschsprung disease. Germline mutations in 1 of 8 codons within RET cause the 3 subtypes of MEN2, namely, MEN2A, MEN2B, and familial medullary thyroid carcinoma. They stated that a somatic M918T mutation (164761.0013) accounts for the largest proportion of RET mutations detected in medullary thyroid carcinomas, most series showing a 30% to 50% range. It appeared that pheochromocytomas have a wider range of RET mutations. In contrast to MEN2, approximately 25% of patients with Hirschsprung disease have germline mutations scattered throughout the length of RET.

[6288]

[6289] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6290] Seri, M.; Yin, L.; Barone, A.; Bolino, A.; Celli, I.; Bocciardi, R.; Pasini, B.; Ceccherini, I.; Lerone, M.; Kristoffersson, U.; Larsson, L. T.; Casasa, J. M.; Cass, D. T.; Abramowicz, M. J.; Vanderwinden, J.- M.; Kravcenkiene, I.; Baric, I.; Silengo, M.; Martucciello, G.; Romeo, G. : Frequency of RET muta-

tions in long- and short- segment Hirschsprung disease. Hum. Mutat. 9: 243- 249, 1997. ; and

[6291] Hoppener, J. W. M.; Lips, C. J. M. : RET receptor tyrosine kinase gene mutations: molecular biological, physiological and clinical aspects. Europ. J. Clin. Invest. 26: 613- 624, 1996.

[6292] Further studies establishing the function and utilities of RET are found in John Hopkins OMIM database record ID 164761, and in cited publications listed in Table 5, which are hereby incorporated by reference.SCRG1 (Accession NP_009212.1) is another GAM47 target gene, herein designated TARGET GENE. SCRG1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SCRG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCRG1 BINDING SITE, designated SEQ ID:18361, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6293] Another function of GAM47 is therefore inhibition of SCRG1 (Accession NP_009212.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCRG1.

[6294] Syndecan 1 (SDC1, Accession NP_002988.3) is another GAM47 target gene, herein designated TARGET GENE. SDC1 BINDING SITE1 and SDC1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SDC1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDC1 BINDING SITE1 and SDC1 BINDING SITE2, designated SEQ ID:8422 and SEQ ID:6892 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6295] Another function of GAM47 is therefore inhibition of Syndecan 1 (SDC1, Accession NP_002988.3), a gene which mediates cell behaviors like cell adhesion, action of growth factors. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC1.

[6296] The function of SDC1 has been established by previous studies. Sanderson et al. (1989) showed that Sdc1 is expressed in mouse only when and where B lymphocytes associate with extracellular matrix, namely as B- cell precursors in bone marrow and as immobilized plasma cells in interstitial matrices. Expression is lost immediately be-

fore maturation and release of B lymphocytes into the circulation and is absent on circulating and mature peripheral B lymphocytes. SDC1 is reexpressed on differentiated plasma cells and is a marker for cells secreting immunoglobulin. By probing a breast epithelial cell line cDNA library with mouse syndecan probes, Mali et al. (1990) obtained a cDNA encoding human SDC1. Sequence analysis predicted that the 310- amino acid human protein is 77% identical to the mouse sequence. SDC1 has an ectodomain, a 25- residue transmembrane domain, and a 34- residue cytoplasmic domain, which are 70%, 96%, and 100% identical to those of the mouse protein, respectively. The ectodomain is preceded by an N- terminal signal peptide and contains 5 potential glycosaminoglycan- attachment sites, 1 potential N- glycosylation site, and a dibasic lys- arg cleavage site adjacent to the transmembrane domain. Northern blot analysis revealed expression of 2.6- and 3.4- kb SDC1 transcripts in mammary epithelial and carcinoma cells and in fetal skin; a 4.5- kb transcript was detected in brain.

[6297] Animal model experiments lend further support to the function of SDC1. Reizes et al. (2001) found that transgenic expression in the hypothalamus of Sdc1 produced

mice with hyperphagia and maturity- onset obesity resembling mice with reduced action of alpha- melanocyte-stimulating hormone (alpha- MSH; OMIM Ref. No. 155555). Via their heparan sulfate chains, syndecans potentiate the action of agouti- related protein (OMIM Ref. No. 602311) and agouti signaling protein (OMIM Ref. No. 600201), endogenous inhibitors of alpha- MSH. In wild-type mice, Sdc3 (OMIM Ref. No. 186357), the predominantly neural syndecan, was expressed in hypothalamic regions that control energy balance. Food deprivation increased hypothalamic Sdc3 levels several- fold. Sdc3 null mice, which otherwise appeared normal, responded to food deprivation with markedly reduced reflex hyperphagia. Reizes et al. (2001) proposed that oscillation of hypothalamic SDC3 levels physiologically modulates feeding behavior.

[6298] It is appreciated that the abovementioned animal model for SDC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6299] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6300] Alexander, C. M.; Reichsman, F.; Hinkes, M. T.; Lincecum, J.; Becker, K. A.; Cumberledge, S.; Bernfield, M. : Syndecan- 1 is required for Wnt- 1- induced mammary tumorigenesis in mice. Nature Genet. 25: 329- 332, 2000. ; and

[6301] Mali, M.; Jaakkola, P.; Arvilommi, A.- M.; Jalkanen, M. : Sequence of human syndecan indicates a novel gene family of integral membrane proteoglycans. J. Biol. Chem. 265: 6884- 6889, 199.

[6302] Further studies establishing the function and utilities of SDC1 are found in John Hopkins OMIM database record ID 186355, and in cited publications listed in Table 5, which are hereby incorporated by reference.SDS3 (Accession XP_045014.1) is another GAM47 target gene, herein designated TARGET GENE. SDS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SDS3 BINDING SITE, designated SEQ ID:5572, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6303] Another function of GAM47 is therefore inhibition of SDS3 (Accession XP_045014.1) . Accordingly, utilities of GAM47

include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDS3.

[6304] SEC15B (Accession XP_039570.3) is another GAM47 target gene, herein designated TARGET GENE. SEC15B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEC15B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:6612, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6305] Another function of GAM47 is therefore inhibition of SEC15B (Accession XP_039570.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15B.

[6306] SEC61A1 (Accession NP_037468.1) is another GAM47 target gene, herein designated TARGET GENE. SEC61A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEC61A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

SEC61A1 BINDING SITE, designated SEQ ID:13837, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6307] Another function of GAM47 is therefore inhibition of SEC61A1 (Accession NP_037468.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC61A1.

[6308] Sema domain, immunoglobulin domain (ig), and gpi membrane anchor, (semaphorin) 7a (SEMA7A, Accession NP_003603.1) is another GAM47 target gene, herein designated TARGET GENE. SEMA7A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEMA7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEMA7A BINDING SITE, designated SEQ ID:17524, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6309] Another function of GAM47 is therefore inhibition of Sema domain, immunoglobulin domain (ig), and gpi membrane anchor, (semaphorin) 7a (SEMA7A, Accession NP_003603.1) . Accordingly, utilities of GAM47 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA7A.

[6310] Secreted frizzled-related protein 2 (SFRP2, Accession XP_050625.1) is another GAM47 target gene, herein designated TARGET GENE. SFRP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFRP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRP2 BINDING SITE, designated SEQ ID:14061, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6311] Another function of GAM47 is therefore inhibition of Secreted frizzled-related protein 2 (SFRP2, Accession XP_050625.1), a gene which receptor for wnt proteins that may modulate Wnt protein function and retinal cell polarization. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP2.

[6312] The function of SFRP2 has been established by previous studies. Melkonyan et al. (1997) isolated cDNAs encoding the related human proteins SARP1 (secreted apoptosis-related protein- 1), SARP2 (SFRP1; 604156) and SARP3

(SFRP5; 604158). Each of these proteins contains a signal peptide followed by an N- terminal cysteine- rich region (CRD) homologous to the extracellular CRD of frizzled-like proteins. The partial human SARP1 cDNA encodes a polypeptide that is 95% identical to mouse Sarp1. When expressed in a breast adenocarcinoma cell line, mouse SARP1 and human SARP2 exhibited opposite effects on cell sensitivity to proapoptotic stimuli. Whereas cells with SARP1 had higher resistance, cells expressing SARP2 were sensitized to apoptosis induced by tumor necrosis factor (OMIM Ref. No. 191160) and ceramide. Expression of SARP1 or SARP2 modified the intracellular levels of beta-catenin (OMIM Ref. No. 116806), an indicator of Wnt-frizzled protein interaction and signal transduction, suggesting that SARPs interfere with the Wnt- frizzled signaling pathway. Northern blot analysis revealed that the SARP genes have distinct expression patterns. SARP1 is expressed as 2.2- and 1.3- kb transcripts in several human tissues, with the highest levels in colon and small intestine. Chang et al. (1999) reported that SARP1, or SFRP2, is highly and preferentially expressed in bovine retina throughout the inner nuclear layer. Within the retina, SARP3, or SFRP5, is specifically expressed in the retinal

pigment epithelium (RPE), suggesting that photoreceptors are bathed by 2 complementary gradients of SFRP signaling molecules/modulators. The authors speculated that these putative inverse gradients of SFRP2 and SFRP5 might be involved in determining the polarity of photoreceptors and perhaps other cells in the retina.

[6313]

[6314] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6315] Melkonyan, H. S.; Chang, W. C.; Shapiro, J. P.; Mahadevappa, M.; Fitzpatrick, P. A.; Kiefer, M. C.; Tomei, L. D.; Umansky, S. R. : SARPs: a family of secreted apoptosis-related proteins. Proc. Nat. Acad. Sci. 94: 13636- 13641, 1997. ; and

[6316] Chang, J. T.; Esumi, N.; Moore, K.; Li, Y.; Zhang, S.; Chew, C.; Goodman, B.; Rattner, A.; Moody, S.; Stetten, G.; Campochiaro, P. A.; Zack, D. J. : Cloning and characterization of a secret.

[6317] Further studies establishing the function and utilities of SFRP2 are found in John Hopkins OMIM database record ID 604157, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sideroflexin 1

(SFXN1, Accession NP_073591.2) is another GAM47 target gene, herein designated TARGET GENE. SFXN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFXN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFXN1 BINDING SITE, designated SEQ ID:7501, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6318] Another function of GAM47 is therefore inhibition of Sideroflexin 1 (SFXN1, Accession NP_073591.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN1.

[6319] Sh3-domain binding protein 2 (SH3BP2, Accession NP_003014.2) is another GAM47 target gene, herein designated TARGET GENE. SH3BP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3BP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, desig-

nated SEQ ID:12033, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6320] Another function of GAM47 is therefore inhibition of Sh3-domain binding protein 2 (SH3BP2, Accession NP_003014.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2.

[6321] Sh3-domain grb2-like endophilin b2 (SH3GLB2, Accession NP_064530.1) is another GAM47 target gene, herein designated TARGET GENE. SH3GLB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3GLB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3GLB2 BINDING SITE, designated SEQ ID:19409, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6322] Another function of GAM47 is therefore inhibition of Sh3-domain grb2-like endophilin b2 (SH3GLB2, Accession NP_064530.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SH3GLB2.

[6323] Split hand/foot malformation (ectrodactyly) type 3 (SHFM3, Accession NP_071322.1) is another GAM47 target gene, herein designated TARGET GENE. SHFM3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SHFM3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SHFM3 BINDING SITE, designated SEQ ID:18245, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6324] Another function of GAM47 is therefore inhibition of Split hand/foot malformation (ectrodactyly) type 3 (SHFM3, Accession NP_071322.1), a gene which probably binds to some phosphorylated proteins and promotes their degradation. and therefore may be associated with Split- hand/ split- foot malformation. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Split- hand/split- foot malformation, and of other diseases and clinical conditions associated with SHFM3.

[6325] The function of SHFM3 has been established by previous studies. By 2- point linkage analysis in a large Turkish

family with isolated SHFM, Ozen et al. (1999) mapped the disorder to 10q24 and narrowed the SHFM3 region from 9 cM to an approximately 2- cM critical interval between genetic markers D10S1147 and D10S1240. In several instances they found a more severe phenotype in offspring of a mildly affected parent, suggesting anticipation. Data from this family, combined with those from 6 other pedigrees mapped to 10q24, demonstrated biased transmission of SHFM3 alleles from affected fathers to offspring. The degree of this segregation distortion was obvious in male offspring and was possibly of the same magnitude for female offspring.

[6326] Animal model experiments lend further support to the function of SHFM3. Early outgrowth of the vertebrate embryonic limb requires signaling by the apical ectodermal ridge (AER) to the progress zone (PZ), which in response proliferates and lays down the pattern of the presumptive limb in a proximal to distal progression. Signals from the PZ maintain the AER until the anlagen for the distal phalanges have been formed. The semidominant mouse mutant dactylaplasia (Dac) disrupts the maintenance of the AER, leading to truncation of distal structures of the developing footplate, or autopod. Adult Dac homozygotes

thus lack hands and feet except for malformed single digits, whereas heterozygotes lack phalanges of the 3 middle digits. Dac resembles the human split- hand/foot malformation. The area of mapping of SHFM3 on 10q24 shows conservation of synteny with the Dac region on mouse chromosome 19; thus, SHFM3 may be due to disruption of the human homolog of Dac. Sidow et al. (1999) reported the positional cloning of Dac and showed that it belongs to the F- box/WD40 gene family, which encodes adaptors that target specific proteins for destruction by presenting them to the ubiquitination machinery. In connection with biochemical studies, this report demonstrated the importance of this gene family in vertebrate embryonic development. Sidow et al. (1999) designated the product of the large gene found to be disrupted by the Dac mutations dactylin. Two different alleles of Dac were found to be due to insertions, a common mechanism of mutation in the mouse.

[6327] It is appreciated that the abovementioned animal model for SHFM3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6328] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[6329] Ozen, R. S.; Baysal, B. E.; Devlin, B.; Farr, J. E.; Gorry, M.; Ehrlich, G. D.; Richard, C. W., III : Fine mapping of the split- hand/split- foot locus (SHFM3) at 10q24: evidence for anticipation and segregation distortion. Am. J. Hum. Genet. 64: 1646- 1654, 1999. ; and

[6330] Sidow, A.; Bulotsky, M. S.; Kerrebrock, A. W.; Birren, B. W.; Altshuler, D; Jaenisch, R.; Johnson, K. R.; Lander, E. S. : A novel member of the F- box/WD40 gene family, encoding dactylin.

[6331] Further studies establishing the function and utilities of SHFM3 are found in John Hopkins OMIM database record ID 600095, and in cited publications listed in Table 5, which are hereby incorporated by reference.S-phase kinase-associated protein 1a (p19a) (SKP1A, Accession NP_733779.1) is another GAM47 target gene, herein designated TARGET GENE. SKP1A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SKP1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

SKP1A BINDING SITE, designated SEQ ID:7175, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6332] Another function of GAM47 is therefore inhibition of S-phase kinase-associated protein 1a (p19a) (SKP1A, Accession NP_733779.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKP1A.

[6333] S-phase kinase-associated protein 1a (p19a) (SKP1A, Accession NP_008861.2) is another GAM47 target gene, herein designated TARGET GENE. SKP1A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SKP1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SKP1A BINDING SITE, designated SEQ ID:7175, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6334] Another function of GAM47 is therefore inhibition of S-phase kinase-associated protein 1a (p19a) (SKP1A, Accession NP_008861.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with SKP1A.

[6335] SLC9A8 (Accession XP_030524.2) is another GAM47 target gene, herein designated TARGET GENE. SLC9A8 BINDING SITE1 and SLC9A8 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SLC9A8, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC9A8 BINDING SITE1 and SLC9A8 BINDING SITE2, designated SEQ ID:9672 and SEQ ID:1205 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6336] Another function of GAM47 is therefore inhibition of SLC9A8 (Accession XP_030524.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A8.

[6337] SMOC1 (Accession NP_071420.1) is another GAM47 target gene, herein designated TARGET GENE. SMOC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMOC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMOC1 BIND-

ING SITE, designated SEQ ID:5573, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6338] Another function of GAM47 is therefore inhibition of SMOC1 (Accession NP_071420.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC1.

[6339] Superoxide dismutase 3, extracellular (SOD3, Accession NP_003093.1) is another GAM47 target gene, herein designated TARGET GENE. SOD3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOD3 BINDING SITE, designated SEQ ID:3673, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6340] Another function of GAM47 is therefore inhibition of Superoxide dismutase 3, extracellular (SOD3, Accession NP_003093.1), a gene which destroys radicals, but when he has a mutation, the extracellular SOD3 increases. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with SOD3.

[6341] The function of SOD3 has been established by previous studies. Marklund (1984) demonstrated that in man the highest levels of SOD3 are found in lung, pancreas, thyroid, and uterus. By RNA gel blot analysis, Folz and Crapo (1994) determined that the highest levels of EC- SOD expression are in adult heart, placenta, pancreas, and lung, followed by moderate expression in kidney, skeletal muscle, and liver. Little EC- SOD mRNA was detected in brain or liver. This pattern of expression is in marked contrast to the relative protein concentration and activity of EC-SOD in these tissues as suggested by Marklund (1984). There may be a substantially higher ratio of enzyme activity to mRNA levels in the brain, pancreas, lung, and kidney, indicating that these tissues have enhanced affinity for circulating EC- SOD or translate the EC- SOD message more efficiently than other tissues. Folz and Crapo (1994) suggested that the EC- SOD gene contains unique transcriptional regulatory elements and that its expression may be regulated at the posttranscriptional or posttranslational level. In the vascular system, SOD3 appears to be located on the endothelial cell surface. The characteristic distinguishing SOD3 from SOD1 and SOD2 is the heparin-

binding capacity. SOD3 binds on the surface of endothelial cells through the heparan sulfate proteoglycan and eliminates the oxygen radicals from the NADP- dependent oxidative system of neutrophils. Adachi et al. (1992) developed an immunoassay system for EC- SOD in order to measure EC- SOD levels in the serum of healthy subjects. They found that 6% of these persons had an SOD3 level that was 10- to 15- fold higher than the mean SOD3 level in all subjects. The familial nature of high serum level was established by Adachi et al. (1993). Sandstrom et al. (1994) reported that about 2% of the plasma donors in Sweden had an 8- to 10- fold higher EC- SOD level and that a single base substitution of C to G at position 760 of the cDNA (185490.0001) was responsible for the high level in plasma. Yamada et al. (1995) performed molecular analysis of the EC- SOD gene from Japanese individuals having a high serum SOD3 level and detected the same C-to- G mutation in healthy persons and hemodialysis patients.

[6342]

[6343] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6344] Sandstrom, J.; Nilsson, P.; Karlsson, K.; Marklund, S. L. : 10- fold increase in human plasma extracellular superoxide dismutase content caused by a mutation in heparin-binding domain. J. Biol. Chem. 269: 19163- 19166, 1994. ; and

[6345] Folz, R. J.; Crapo, J. D. : Extracellular superoxide dismutase (SOD3): tissue- specific expression, genomic characterization, and computer- assisted sequence analysis of the human EC SOD gene.

[6346] Further studies establishing the function and utilities of SOD3 are found in John Hopkins OMIM database record ID 185490, and in cited publications listed in Table 5, which are hereby incorporated by reference.Secreted protein, acidic, cysteine-rich (osteonectin) (SPARC, Accession NP_003109.1) is another GAM47 target gene, herein designated TARGET GENE. SPARC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPARC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPARC BINDING SITE, designated SEQ ID:10553, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6347] Another function of GAM47 is therefore inhibition of Secreted protein, acidic, cysteine-rich (osteonectin) (SPARC, Accession NP_003109.1), a gene which .appears to regulate cell growth through interactions with the extracellular matrix and cytokines. binds calcium and copper, several types of collagen, albumin, thrombospondin, pdgf and cell membranes. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPARC.

[6348] The function of SPARC has been established by previous studies. PARC is identical to osteonectin (from Latin verb nectere, to bind, bridge or link), a protein important to bone calcification which was identified by Termine et al. (1981). It is a 32,000- dalton, bone- specific phosphoprotein that binds selectively to hydroxyapatite and to collagen fibrils at distinct sites. Osteonectin accounts for the unique property of bone collagen to undergo calcification; type I collagen of bone is identical to that of skin and tendon. In bone, it is present in a concentration of 2.3 micrograms per 10 micrograms of protein. It is present also in dentin but absent from all other tissues. By comparison of protein sequences as well as investigation of the genes, Findlay et al. (1988) concluded that osteonectin

is highly conserved between species. Naylor et al. (1989) demonstrated RFLPs of the ON gene which should be useful as markers on chromosome 5 and for investigating the possible role of osteonectin in bone diseases. SPARC, which can be selectively expressed by the endothelium in response to certain types of injury, induces rounding in adherent endothelial cells in vitro. From the results of studies on the influence of SPARC on endothelial permeability, Goldblum et al. (1994) concluded that SPARC regulates endothelial barrier function through F- actin- dependent changes in cell shape, coincident with the appearance of intercellular gaps, that provide a paracellular pathway for extravasation of macromolecules.

[6349] Animal model experiments lend further support to the function of SPARC. Gilmour et al. (1998) generated mice deficient for SPARC by targeted disruption. SPARC- deficient mice appeared normal and fertile until around 6 months of age, when they developed severe eye pathology characterized by cataract formation and rupture of the lens capsule. The first sign of lens pathology occurred in the equatorial bow region where vacuoles gradually formed within differentiating epithelial cells and fiber cells. The lens capsule, however, showed no qualitative

changes in the major basal lamina proteins laminin, collagen IV, perlecan, or entactin.

[6350] It is appreciated that the abovementioned animal model for SPARC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6351] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6352] Gilmour, D. T.; Lyon, G. J.; Carlton, M. B. L.; Sanes, J. R.; Cunningham, J. M.; Anderson, J. R.; Hogan, B. L. M.; Evans, M. J.; Colledge, W. H. : Mice deficient for the secreted glycoprotein SPARC/osteonectin/BM40 develop normally but show severe age- onset cataract formation and disruption of the lens. EMBO J. 17: 1860- 1870, 1998. ; and

[6353] Le Beau et al. (1993) mapped the SPARC gene to 5q31.3-q32. SGoldblum, S. E.; Ding, X.; Funk, S. E.; Sage, E. H. : SPARC (secreted protein acidic and rich in cysteine) regulates endotheli.

[6354] Further studies establishing the function and utilities of SPARC are found in John Hopkins OMIM database record ID 182120, and in cited publications listed in Table 5, which are hereby incorporated by refer-

ence.Sparc/osteonectin, cwcv and kazal-like domains proteoglycan (testican) (SPOCK, Accession NP_004589.1) is another GAM47 target gene, herein designated TARGET GENE. SPOCK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPOCK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:11060, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6355] Another function of GAM47 is therefore inhibition of Sparc/osteonectin, cwcv and kazal-like domains proteoglycan (testican) (SPOCK, Accession NP_004589.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPOCK.

[6356] SPRR4 (Accession NP_775103.1) is another GAM47 target gene, herein designated TARGET GENE. SPRR4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPRR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of SPRR4 BINDING SITE, designated SEQ ID:18654, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6357] Another function of GAM47 is therefore inhibition of SPRR4 (Accession NP_775103.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRR4.

[6358] Sequestosome 1 (SQSTM1, Accession NP_003891.1) is another GAM47 target gene, herein designated TARGET GENE. SQSTM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SQSTM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SQSTM1 BINDING SITE, designated SEQ ID:18350, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6359] Another function of GAM47 is therefore inhibition of Sequestosome 1 (SQSTM1, Accession NP_003891.1), a gene which binds SH2 domain of p56lck and ubiquitin, and it is associated with a serine/threonine kinase activity and therefore is associated with Paget disease of bone. Ac-

cordingly, utilities of GAM47 include diagnosis, prevention and treatment of Paget disease of bone, and of other diseases and clinical conditions associated with SQSTM1.

[6360] The function of SQSTM1 has been established by previous studies. Using 24 French Canadian families and 112 unrelated individuals with Paget disease of bone (OMIM Ref. No. 602080), Laurin et al. (2002) confined the PDB3 locus (OMIM Ref. No. 606262) on 5q35- qter to a region of approximately 300 kb. Within this interval, 2 disease- related haplotype signatures were observed in 11 families and 18 unrelated patients. This region encoded the SQSTM1 gene, which is a candidate gene for PDB because of its association with the RANK pathway (see OMIM Ref. No. 603499). Screening SQSTM1 for mutations led to the identification of a recurrent nonconservative change (P392L; 601530.0001) flanking the ubiquitin- associated domain (UBA; position 394- 440) of the protein that was not present in 291 control individuals. The data demonstrated that 2 independent mutational events at the same position in SQSTM1 cause Paget disease of bone in a high proportion of French Canadian patients. The Src homology type 2 (SH2) domain is a highly conserved motif of about 100 amino acids which mediates protein- protein interac-

tions by binding to phosphotyrosine. p56- lck (OMIM Ref. No. 153390), a T- cell- specific src family tyrosine kinase with an SH2 domain, is involved in T- cell signal transduction. A 62- kD protein (p62) was identified by Park et al. (1995) as a ligand of the p56- lck SH2 domain. Park et al. (1995) found that the p56- lck SH2 domain binds to p62 at the ser59 of p62 only when that serine is phosphorylated. Moreover, Park et al. (1995) found that p62 is associated with a serine/threonine kinase activity and also binds to ras GTP- ase- activating protein, a negative regulator of the ras signaling pathway.

[6361]

[6362] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6363] Laurin, N.; Brown, J. P.; Morissette, J.; Raymond, V. : Recurrent mutation of the gene encoding sequestosome 1 (SQSTM1/p62) in Paget disease of bone. Am. J. Hum. Genet. 70: 1582- 1588, 2002. ; and

[6364] Park, I.; Chung, J.; Walsh, C. T.; Yun, Y.; Strominger, J. L.; Shin, J. : Phosphotyrosine- independent binding of a 62-kDa protein to the src homology 2 (SH2) domain of p56-lck and its regu.

[6365] Further studies establishing the function and utilities of SQSTM1 are found in John Hopkins OMIM database record ID 601530, and in cited publications listed in Table 5, which are hereby incorporated by reference.Signal transducer and activator of transcription 3 (acute-phase response factor) (STAT3, Accession NP_003141.2) is another GAM47 target gene, herein designated TARGET GENE. STAT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STAT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAT3 BINDING SITE, designated SEQ ID:19871, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6366] Another function of GAM47 is therefore inhibition of Signal transducer and activator of transcription 3 (acute-phase response factor) (STAT3, Accession NP_003141.2), a gene which carries out a dual function: signal transduction and activation of transcription. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT3.

[6367] The function of STAT3 has been established by previous studies. Akira et al. (1994) purified acute- phase response factor (APRF), also designated STAT3, and cloned the cDNA. At the amino acid level, APRF exhibited 52.5% overall homology with p91, a component of the interferon (IFN)- stimulated gene factor- 3 complexes. Also see STAT1 (OMIM Ref. No. 600555). Caldenhoven et al. (1996) reported the cloning of a cDNA encoding a variant of the transcription factor STAT3, designated STAT3- beta, that was isolated by screening an eosinophil cDNA library. Compared to wildtype STAT3, STAT3- beta lacks an internal domain of 50 bp located near the C terminus. This splice product is a naturally occurring isoform of STAT3 and encodes an 80- kD protein.

[6368] Animal model experiments lend further support to the function of STAT3. Alternative splicing of the STAT3 gene produces 2 isoforms, STAT3- alpha and a dominant- negative variant, STAT3- beta. In STAT3- beta, the 55 C- terminal residues of STAT3- alpha, spanning the intrinsic transactivation domain, are replaced by 7 distinct residues. Yoo et al. (2002) generated Stat3- beta- deficient mice by gene targeting. Despite intact expression and phosphorylation of Stat3- alpha, overall Stat3 activity

was impaired in Stat3- beta - /- cells. Global comparison of transcription in Stat3- beta +/+ and Stat3- beta - /- cells revealed stable differences. Stat3- beta- deficient mice exhibited diminished recovery from endotoxic shock and hyperresponsiveness of a subset of endotoxin- inducible genes in liver. The hepatic response to endotoxin in wildtype mice was accompanied by a transient increase in the ratio of Stat3- beta to Stat3- alpha. These findings indicated a critical role for Stat3- beta in the control of systemic inflammation.

[6369] It is appreciated that the abovementioned animal model for STAT3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6370] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6371] Caldenhoven, E.; van Dijk, T. B.; Solari, R.; Armstrong, J.; Raaijmakers, J. A. M.; Lammers, J.- W. J.; Koenderman, L.; de Groot, R. P. : STAT3- beta, a splice variant of transcription factor STAT3, is a dominant negative regulator of transcription. J. Biol. Chem. 271: 13221- 13227, 1996. ; and

[6372] Yoo, J.- Y.; Huso, D. L.; Nathans, D.; Desiderio, S. : Specific ablation of Stat3- beta distorts the pattern of Stat3-responsive gene expression and impairs recovery from endotoxic shock.

[6373] Further studies establishing the function and utilities of STAT3 are found in John Hopkins OMIM database record ID 102582, and in cited publications listed in Table 5, which are hereby incorporated by reference.Signal transducer and activator of transcription 3 (acute-phase response factor) (STAT3, Accession NP_644805.1) is another GAM47 target gene, herein designated TARGET GENE. STAT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STAT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAT3 BINDING SITE, designated SEQ ID:19871, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6374] Another function of GAM47 is therefore inhibition of Signal transducer and activator of transcription 3 (acute-phase response factor) (STAT3, Accession NP_644805.1), a gene which carries out a dual function:

signal transduction and activation of transcription. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT3.

[6375] The function of STAT3 has been established by previous studies. Akira et al. (1994) purified acute- phase response factor (APRF), also designated STAT3, and cloned the cDNA. At the amino acid level, APRF exhibited 52.5% overall homology with p91, a component of the interferon (IFN)- stimulated gene factor- 3 complexes. Also see STAT1 (OMIM Ref. No. 600555). Caldenhoven et al. (1996) reported the cloning of a cDNA encoding a variant of the transcription factor STAT3, designated STAT3- beta, that was isolated by screening an eosinophil cDNA library. Compared to wildtype STAT3, STAT3- beta lacks an internal domain of 50 bp located near the C terminus. This splice product is a naturally occurring isoform of STAT3 and encodes an 80- kD protein.

[6376] Animal model experiments lend further support to the function of STAT3. Alternative splicing of the STAT3 gene produces 2 isoforms, STAT3- alpha and a dominant- negative variant, STAT3- beta. In STAT3- beta, the 55 C- terminal residues of STAT3- alpha, spanning the intrinsic

transactivation domain, are replaced by 7 distinct residues. Yoo et al. (2002) generated Stat3- beta- deficient mice by gene targeting. Despite intact expression and phosphorylation of Stat3- alpha, overall Stat3 activity was impaired in Stat3- beta - /- cells. Global comparison of transcription in Stat3- beta +/+ and Stat3- beta - /- cells revealed stable differences. Stat3- beta- deficient mice exhibited diminished recovery from endotoxic shock and hyperresponsiveness of a subset of endotoxin- inducible genes in liver. The hepatic response to endotoxin in wildtype mice was accompanied by a transient increase in the ratio of Stat3- beta to Stat3- alpha. These findings indicated a critical role for Stat3- beta in the control of systemic inflammation.

[6377] It is appreciated that the abovementioned animal model for STAT3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6378] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6379] Caldenhoven, E.; van Dijk, T. B.; Solari, R.; Armstrong, J.; Raaijmakers, J. A. M.; Lammers, J.- W. J.; Koenderman, L.;

de Groot, R. P. : STAT3- beta, a splice variant of transcription factor STAT3, is a dominant negative regulator of transcription. J. Biol. Chem. 271: 13221- 13227, 1996. ; and

[6380] Yoo, J.- Y.; Huso, D. L.; Nathans, D.; Desiderio, S. : Specific ablation of Stat3- beta distorts the pattern of Stat3- responsive gene expression and impairs recovery from endotoxic shock.

[6381] Further studies establishing the function and utilities of STAT3 are found in John Hopkins OMIM database record ID 102582, and in cited publications listed in Table 5, which are hereby incorporated by reference.Serine/threonine kinase 16 (STK16, Accession NP_003682.1) is another GAM47 target gene, herein designated TARGET GENE. STK16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STK16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STK16 BINDING SITE, designated SEQ ID:5128, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6382] Another function of GAM47 is therefore inhibition of Ser-

ine/threonine kinase 16 (STK16, Accession NP_003682.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK16.

[6383] Syntaxin 6 (STX6, Accession NP_005810.1) is another GAM47 target gene, herein designated TARGET GENE. STX6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STX6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STX6 BINDING SITE, designated SEQ ID:15081, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6384] Another function of GAM47 is therefore inhibition of Syntaxin 6 (STX6, Accession NP_005810.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX6.

[6385] Sulfotransferase family, cytosolic, 1b, member 1 (SULT1B1, Accession NP_055280.2) is another GAM47 target gene, herein designated TARGET GENE. SULT1B1 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by SULT1B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SULT1B1 BINDING SITE, designated SEQ ID:12908, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6386] Another function of GAM47 is therefore inhibition of Sulfotransferase family, cytosolic, 1b, member 1 (SULT1B1, Accession NP_055280.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1B1.

[6387] Suppressor of variegation 3-9 homolog 1 (drosophila) (SUV39H1, Accession NP_003164.1) is another GAM47 target gene, herein designated TARGET GENE. SUV39H1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SUV39H1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUV39H1 BINDING SITE, designated SEQ ID:11187, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6388] Another function of GAM47 is therefore inhibition of Suppressor of variegation 3-9 homolog 1 (drosophila) (SUV39H1, Accession NP_003164.1), a gene which is homolog of Drosophila suppressor of variegation 3- 9 and modifies position effect variegation. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H1.

[6389] The function of SUV39H1 has been established by previous studies. By screening a human B- cell cDNA library with a sequence encoding the C- terminal portion of the Drosophila Su(var)3- 9 gene product, which contains the SET domain, Aagaard et al. (1999) isolated a cDNA encoding SUV39H1. The predicted 412- amino acid SUV39H1 protein contains a chromodomain that is located close to the N terminus, a cysteine- rich region, an adjacent C-terminal SET domain that is followed at the very C- terminal tail by 3 conserved cysteine residues, and a putative nuclear localization signal. SUV39H1 shares 95% amino acid sequence identity with mouse Suv39h1, 42% identity with Drosophila Su(var)3- 9, and 38% identity with S. pombe CLR4, another Su(var)3- 9 ortholog. Immunoblot analysis of protein extracts from human cell lines detected an approximately 48- kD endogenous SUV39H1 protein, a

mass that corresponds with the mass calculated from the SUV39H1 cDNA. Immunodetection of endogenous SUV39H1 protein revealed enriched distribution at heterochromatic foci during interphase and centromere- specific localization during metaphase. In addition, SUV39H1 protein associated with M31 (HP1- beta, or CBX1; 604511), an Su(var) homolog, indicating the existence of an Su(var) protein complex.

[6390] Animal model experiments lend further support to the function of SUV39H1. Peters et al. (2001) generated mice deficient for either Suv39h1 or Suv39h2 (OMIM Ref. No. 606503). These animals displayed normal viability and fertility and did not exhibit apparent phenotypes. The authors subsequently intercrossed Suv39h1 - /- and Suv39h2 - /- mice to generate compound Suv39h mutants that were then used to derive Suv39h double- null mice (Suv39h1 - /- and Suv39h2 - /-). These mice displayed severely impaired viability and chromosomal instabilities that were associated with an increased tumor risk and perturbed chromosome interactions during male meiosis. These data suggested a crucial role for pericentric H3 histone- lys9 methylation in protecting genome stability and defined the Suv39h HMTases as important

epigenetic regulators for mammalian development.

[6391] It is appreciated that the abovementioned animal model for SUV39H1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6392] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6393] Aagaard, L.; Laible, G.; Selenko, P.; Schmid, M.; Dorn, R.; Schotta, G.; Kuhfittig, S.; Wolf, A.; Lebersorger, A.; Singh, P. B.; Reuter, G.; Jenuwein, T. : Functional mammalian homologues of the Drosophila PEV- modifier Su(var)3- 9 encode centromere- associated proteins which complex with the heterochromatin component M31. [6395] Further studies establishing the function and utilities of SUV39H1 are found in John Hopkins OMIM database record ID 300254, and in cited publications listed in Table 5, which are hereby incorporated by refer-

ence.Synaptotagmin ii (SYT2, Accession NP_796376.2) is another GAM47 target gene, herein designated TARGET GENE. SYT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYT2 BINDING SITE, designated SEQ ID:3462, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6396] Another function of GAM47 is therefore inhibition of Synaptotagmin ii (SYT2, Accession NP_796376.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT2.

[6397] Synaptotagmin vi (SYT6, Accession XP_086135.1) is another GAM47 target gene, herein designated TARGET GENE. SYT6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SYT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYT6 BINDING SITE, designated SEQ ID:7804,

to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6398] Another function of GAM47 is therefore inhibition of Synaptotagmin vi (SYT6, Accession XP_086135.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT6.

[6399] Synaptotagmin-like 2 (SYTL2, Accession NP_115755.2) is another GAM47 target gene, herein designated TARGET GENE. SYTL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SYTL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYTL2 BINDING SITE, designated SEQ ID:13084, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6400] Another function of GAM47 is therefore inhibition of Synaptotagmin-like 2 (SYTL2, Accession NP_115755.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL2.

[6401] Synaptotagmin-like 2 (SYTL2, Accession NP_116561.1) is another GAM47 target gene, herein designated TARGET GENE. SYTL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SYTL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYTL2 BINDING SITE, designated SEQ ID:13084, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6402] Another function of GAM47 is therefore inhibition of Synaptotagmin-like 2 (SYTL2, Accession NP_116561.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL2.

[6403] Taf9-like rna polymerase ii, tata box binding protein (tbp)-associated factor, 31kda (TAF9L, Accession NP_057059.2) is another GAM47 target gene, herein designated TARGET GENE. TAF9L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TAF9L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18397, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6404] Another function of GAM47 is therefore inhibition of Taf9-like rna polymerase ii, tata box binding protein (tbp)-associated factor, 31kda (TAF9L, Accession NP_057059.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L.

[6405] T-box 15 (TBX15, Accession NP_689593.1) is another GAM47 target gene, herein designated TARGET GENE. TBX15 BINDING SITE1 and TBX15 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TBX15, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX15 BINDING SITE1 and TBX15 BINDING SITE2, designated SEQ ID:4394 and SEQ ID:5309 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6406] Another function of GAM47 is therefore inhibition of T-box 15 (TBX15, Accession NP_689593.1) . Accordingly,

utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX15.

[6407] T-box 19 (TBX19, Accession NP_005140.1) is another GAM47 target gene, herein designated TARGET GENE. TBX19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBX19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX19 BINDING SITE, designated SEQ ID:14889, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6408] Another function of GAM47 is therefore inhibition of T-box 19 (TBX19, Accession NP_005140.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX19.

[6409] Transcription factor-like 4 (TCFL4, Accession NP_037515.2) is another GAM47 target gene, herein designated TARGET GENE. TCFL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TCFL4, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:9522, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6410] Another function of GAM47 is therefore inhibition of Transcription factor-like 4 (TCFL4, Accession NP_037515.2), a gene which interacts with Mad and represses transcription by recruiting the Sin3A- histone deacetylase corepressor complex. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4.

[6411] The function of TCFL4 has been established by previous studies. Members of the basic helix- loop- helix leucine zipper (bHLH- Zip) family are transcription factors with roles in proliferation, determination, and differentiation (e.g., MAX; 154950). By searching sequence databases with a mouse Tcfl4 cDNA, Bjerknes and Cheng (1996) identified several TCFL4 expressed sequence tags derived from a variety of human tissues, and a 46- kb cosmid clone (GenBank U34879) containing the human TCFL4 gene. This cosmid, which maps to 17q21.1, also contains

the HSD17B1 gene (OMIM Ref. No. 109684). The TCFL4 gene has 8 exons and spans more than 5 kb. The predicted TCFL4 protein contains a basic helix- loop- helix domain and a leucine zipper domain. RT- PCR detected mouse Tcfl4 expression in all tissues examined. In a 2-hybrid screen to identify Mad1 (OMIM Ref. No. 602686)-interacting proteins, Billin et al. (1999) identified TCFL4 as MLX, a bHLH- Zip protein that is structurally and functionally related to MAX. The predicted amino acid sequence of MLX is conserved at all positions that define the bHLH- Zip class of transcription factors and is most similar to that of MAX, sharing approximately 50% identity in the bHLH- Zip domains. The 244- amino acid human and mouse MLX proteins differ at only 4 amino acid positions. Billin et al. (1999) showed that transcriptional repression by Mad1:Mlx heterodimers is dependent on dimerization, DNA binding, and recruitment of the Sin3A- histone deacetylase (see OMIM Ref. No. 601241) corepressor complex. Their findings suggested that MLX may act to diversify Mad family function by its restricted association with a subset of the Mad family of transcriptional repressors.

[6412]

[6413] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6414] Billin, A. N.; Eilers, A. L.; Queva, C.; Ayer, D. E. : Mlx, a novel Max- like BHLHZip protein that interacts with the Max network of transcription factors. J. Biol. Chem. 274: 36344- 36350, 1999. ; and

[6415] Bjerknes, M.; Cheng, H. : TCFL4: a gene at 17q21.1 encoding a putative basic helix- loop- helix leucine- zipper transcription factor. Gene 181: 7- 11, 1996.

[6416] Further studies establishing the function and utilities of TCFL4 are found in John Hopkins OMIM database record ID 602976, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transcription factor-like 4 (TCFL4, Accession NP_733753.1) is another GAM47 target gene, herein designated TARGET GENE. TCFL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TCFL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:9522, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[6417] Another function of GAM47 is therefore inhibition of Transcription factor-like 4 (TCFL4, Accession NP_733753.1), a gene which interacts with Mad and represses transcription by recruiting the Sin3A- histone deacetylase corepressor complex. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4.

[6418] The function of TCFL4 has been established by previous studies. Members of the basic helix- loop- helix leucine zipper (bHLH- Zip) family are transcription factors with roles in proliferation, determination, and differentiation (e.g., MAX; 154950). By searching sequence databases with a mouse Tcfl4 cDNA, Bjerknes and Cheng (1996) identified several TCFL4 expressed sequence tags derived from a variety of human tissues, and a 46- kb cosmid clone (GenBank U34879) containing the human TCFL4 gene. This cosmid, which maps to 17q21.1, also contains the HSD17B1 gene (OMIM Ref. No. 109684). The TCFL4 gene has 8 exons and spans more than 5 kb. The predicted TCFL4 protein contains a basic helix- loop- helix domain and a leucine zipper domain. RT- PCR detected mouse Tcfl4 expression in all tissues examined. In a 2-

hybrid screen to identify Mad1 (OMIM Ref. No. 602686)-interacting proteins, Billin et al. (1999) identified TCFL4 as MLX, a bHLH- Zip protein that is structurally and functionally related to MAX. The predicted amino acid sequence of MLX is conserved at all positions that define the bHLH- Zip class of transcription factors and is most similar to that of MAX, sharing approximately 50% identity in the bHLH- Zip domains. The 244- amino acid human and mouse MLX proteins differ at only 4 amino acid positions. Billin et al. (1999) showed that transcriptional repression by Mad1:Mlx heterodimers is dependent on dimerization, DNA binding, and recruitment of the Sin3A- histone deacetylase (see OMIM Ref. No. 601241) corepressor complex. Their findings suggested that MLX may act to diversify Mad family function by its restricted association with a subset of the Mad family of transcriptional repressors.

[6419]

[6420] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6421] Billin, A. N.; Eilers, A. L.; Queva, C.; Ayer, D. E. : Mlx, a novel Max- like BHLHZip protein that interacts with the

Max network of transcription factors. J. Biol. Chem. 274: 36344- 36350, 1999. ; and

[6422] Bjerknes, M.; Cheng, H. : TCFL4: a gene at 17q21.1 encoding a putative basic helix- loop- helix leucine- zipper transcription factor. Gene 181: 7- 11, 1996.

[6423] Further studies establishing the function and utilities of TCFL4 are found in John Hopkins OMIM database record ID 602976, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transcription factor-like 4 (TCFL4, Accession NP_733752.1) is another GAM47 target gene, herein designated TARGET GENE. TCFL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TCFL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:9522, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6424] Another function of GAM47 is therefore inhibition of Transcription factor-like 4 (TCFL4, Accession NP_733752.1), a gene which interacts with Mad and represses transcription by recruiting the Sin3A- histone

deacetylase corepressor complex. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4.

[6425] The function of TCFL4 has been established by previous studies. Members of the basic helix- loop- helix leucine zipper (bHLH- Zip) family are transcription factors with roles in proliferation, determination, and differentiation (e.g., MAX; 154950). By searching sequence databases with a mouse Tcfl4 cDNA, Bjerknes and Cheng (1996) identified several TCFL4 expressed sequence tags derived from a variety of human tissues, and a 46- kb cosmid clone (GenBank U34879) containing the human TCFL4 gene. This cosmid, which maps to 17q21.1, also contains the HSD17B1 gene (OMIM Ref. No. 109684). The TCFL4 gene has 8 exons and spans more than 5 kb. The predicted TCFL4 protein contains a basic helix- loop- helix domain and a leucine zipper domain. RT- PCR detected mouse Tcfl4 expression in all tissues examined. In a 2-hybrid screen to identify Mad1 (OMIM Ref. No. 602686)-interacting proteins, Billin et al. (1999) identified TCFL4 as MLX, a bHLH- Zip protein that is structurally and functionally related to MAX. The predicted amino acid sequence of MLX is conserved at all positions that define the

bHLH- Zip class of transcription factors and is most similar to that of MAX, sharing approximately 50% identity in the bHLH- Zip domains. The 244- amino acid human and mouse MLX proteins differ at only 4 amino acid positions. Billin et al. (1999) showed that transcriptional repression by Mad1:Mlx heterodimers is dependent on dimerization, DNA binding, and recruitment of the Sin3A- histone deacetylase (see OMIM Ref. No. 601241) corepressor complex. Their findings suggested that MLX may act to diversify Mad family function by its restricted association with a subset of the Mad family of transcriptional repressors.

[6426]

[6427] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6428] Billin, A. N.; Eilers, A. L.; Queva, C.; Ayer, D. E. : Mlx, a novel Max- like BHLHZip protein that interacts with the Max network of transcription factors. J. Biol. Chem. 274: 36344- 36350, 1999. ; and

[6429] Bjerknes, M.; Cheng, H. : TCFL4: a gene at 17q21.1 encoding a putative basic helix- loop- helix leucine- zipper transcription factor. Gene 181: 7- 11, 1996.

[6430] Further studies establishing the function and utilities of TCFL4 are found in John Hopkins OMIM database record ID 602976, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-cell leukemia/lymphoma 1b (TCL1B, Accession NP_004909.1) is another GAM47 target gene, herein designated TARGET GENE. TCL1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCL1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCL1B BINDING SITE, designated SEQ ID:19739, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6431] Another function of GAM47 is therefore inhibition of T-cell leukemia/lymphoma 1b (TCL1B, Accession NP_004909.1), a gene which is a a member of the TCL1 family that is activated in chronic t- cell leukemias (t- cll) and therefore may be associated with Chronic t- cell leukemias. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Chronic t- cell leukemias, and of other diseases and clinical conditions associated with TCL1B.

[6432] The function of TCL1B has been established by previous studies. The TCL1A oncogene (OMIM Ref. No. 186960) on 14q32.1 is involved in the development of T- cell leukemia. Its expression in these leukemias is activated by chromosomal translocations and inversions at 14q32.1. By searching an EST database for sequences homologous to TCL1A and MTCP1 (OMIM Ref. No. 300116), a member of the TCL1 gene family that is located on Xq28 and is activated in rare cases of mature T- cell leukemia with a t(X;14) translocation, Pekarsky et al. (1999) isolated TCL1B, a novel member of the TCL1 gene family. The approximately 1.2- kb TCL1B cDNA encodes a 14- kD protein that contains 128 amino acids and shows 60% sequence similarity to the TCL1A protein. By PCR analysis of a radiation hybrid panel, they mapped the TCL1B gene to chromosome 14q32.1. Pulse- field analysis of a positive BAC clone revealed that the TCL1B gene is located approximately 16 kb centromeric of the TCL1A gene. Expression profiles of the 2 genes are very similar: both genes are expressed at very low levels in normal bone marrow and peripheral lymphocytes but are activated in T- cell leukemia by rearrangement of the 14q32.1 region. Thus, translocations and inversions at 14q32.1 in T- cell

malignancies involve 2 oncogenes. Hallas et al. (1999) presented cloning, mapping, and expression analysis of the human and murine TCL1/Tcl1 locus. In addition to TCL1A and TCL1B, the human locus contains 2 additional genes, TNG1 (TCL1- neighboring gene- 1; 604412) and TNG2 (OMIM Ref. No. 604413), encoding proteins of 141 and 110 amino acids, respectively. Both genes showed no homology to any known genes, but their expression profiles were very similar to those of TCL1A and TCL1B. TNG1 and TNG2 also were activated in T cell leukemias with rearrangements at 14q32.1. To aid in the development of the mouse model, Hallas et al. (1999) characterized the murine Tcl1a locus and found 5 genes homologous to human TCL1B. The 5 Tcl1b proteins ranged in size from 117 to 123 amino acids and were 65 to 80% similar, but they showed only a 30 to 40% similarity to human TCL1B. All murine Tcl1b and Tcl1a mRNAs were abundant in mouse oocytes and 2- cell embryos but rare in various adult tissues and lymphoid cell lines. These data suggested a similar or complementary function of these proteins in early embryogenesis.

[6433]

[6434] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[6435] Pekarsky, Y.; Hallas, C.; Isobe, M.; Russo, G.; Croce, C. M. : Abnormalities at 14q32.1 in T cell malignancies involve two oncogenes. Proc. Nat. Acad. Sci. 96: 2949- 2951, 1999. ; and

[6436] Hallas, C.; Pekarsky, Y.; Itoyama, T.; Varnum, J.; Bichi, R.; Rothstein, J. L.; Croce, C. M. : Genomic analysis of human and mouse TCL1 loci reveals a complex of tightly clustered genes.

[6437] Further studies establishing the function and utilities of TCL1B are found in John Hopkins OMIM database record ID 603769, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transcription factor dp-2 (e2f dimerization partner 2) (TFDP2, Accession NP_006277.1) is another GAM47 target gene, herein designated TARGET GENE. TFDP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TFDP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TFDP2 BINDING SITE, designated SEQ ID:17242, to the nucleotide sequence of GAM47 RNA,

herein designated GAM RNA, also designated SEQ ID:269.

[6438] Another function of GAM47 is therefore inhibition of Transcription factor dp-2 (e2f dimerization partner 2) (TFDP2, Accession NP_006277.1), a gene which is required for the progression of S- phase during the cell cycle. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFDP2.

[6439] The function of TFDP2 has been established by previous studies. Zhang and Chellappan (1995) cloned an E2F dimerization partner, transcription factor DP2, from a human kidney cDNA library. The TFDP2 gene encodes a predicted 386- amino acid protein that is 68% identical to TFDP1 (OMIM Ref. No. 189902). Northern blot analysis revealed 5 distinct transcript sizes ranging from 1.4 to 9.5 kb, with expression of at least one size observed in all cell lines tested. TFDP2 is able to form a functional heterodimer with E2F1 (OMIM Ref. No. 189971). Zhang et al. (1997) used fluorescence in situ hybridization to map the TFDP2 gene to human chromosome 3q23.

[6440]

[6441] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[6442] Zhang, Y.; Chellappan, S. P. : Cloning and characterization of human DP2, a novel dimerization partner of E2F. Oncogene 10: 2085- 2093, 1995. ; and

[6443] Zhang, Y.; Venkatraj, V. S.; Fischer, S. G.; Warburton, D.; Chellappan, S. P. : Genomic cloning and chromosomal assignment of the E2F dimerization partner TFDP gene family. Genomics 39:.

[6444] Further studies establishing the function and utilities of TFDP2 are found in John Hopkins OMIM database record ID 602160, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transforming growth factor, beta receptor iii (betaglycan, 300kda) (TGFBR3, Accession NP_003234.1) is another GAM47 target gene, herein designated TARGET GENE. TGFBR3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFBR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGFBR3 BINDING SITE, designated SEQ ID:17248, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6445] Another function of GAM47 is therefore inhibition of Transforming growth factor, beta receptor iii (betaglycan, 300kda) (TGFBR3, Accession NP_003234.1), a gene which involves in capturing and retaining TGF- beta for presentation to the signaling receptors. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR3.

[6446] The function of TGFBR3 has been established by previous studies. In addition to type I TGF- beta receptor (TGFBR1; 190181) and type II (TFGBR2; 190182), type III (OMIM Ref. No. TGFBR3) has been identified. It is a glycoprotein that binds TGF- beta and exists in both a membrane- bound and a soluble form. It may serve as a receptor accessory molecule in both the TGF- beta and fibroblast growth factor systems. TGFBR3 lacks a recognizable signaling domain and has no clearly defined role in TGF- beta signaling. To investigate TGFBR3 function, Brown et al. (1999) studied cardiac endothelial cells in chick atrioventricular cushion explants. Endothelial cells undergoing epithelial-mesenchymal transformation expressed TGFBR3, and TGFBR3- specific antisera were found to inhibit mesenchyme formation and migration. Misexpression of TGFBR3 in nontransforming ventricular endothelial cells

conferred transformation in response to TGFB2. These results supported a model where TGFBR3 localizes transformation in the heart and plays an essential, nonredundant role in TGF- beta signaling. Lewis et al. (2000) demonstrated that the type III TGF- beta receptor, or beta- glycan, can function as an inhibin (see OMIM Ref. No. 147380) coreceptor with ActRII (OMIM Ref. No. 102581). Beta- glycan binds inhibin with high affinity and enhances binding in cells coexpressing ActRII and beta- glycan. Inhibin also forms crosslinked complexes with both recombinant and endogenously expressed beta- glycan and ActRII. Lewis et al. (2000) demonstrated that beta- glycan confers inhibin sensitivity to cell lines that otherwise respond poorly to this hormone. The ability of beta- glycan to inhibit to facilitate inhibin antagonism of activin (see OMIM Ref. No. 147290) provided a variation on the emerging roles of proteoglycans as coreceptors modulating ligand- receptor sensitivity, selectivity, and function.

[6447]

[6448] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6449] Brown, C. B.; Boyer, A. S.; Runyan, R. B.; Barnett, J. V. : Re-

quirement of type III TGF- beta receptor for endocardial cell transformation in the heart. Science 283: 2080- 2082, 1999. ; and

[6450] Lewis, K. A.; Gray, P. C.; Blount, A. L.; MacConell, L. A.; Wiater, E.; Bilezikjian, L. M.; Vale, W. : Betaglycan binds inhibin and can mediate functional antagonism of activin signalli.

[6451] Further studies establishing the function and utilities of TGFBR3 are found in John Hopkins OMIM database record ID 600742, and in cited publications listed in Table 5, which are hereby incorporated by reference.Translocase of inner mitochondrial membrane 22 homolog (yeast) (TIMM22, Accession NP_037469.1) is another GAM47 target gene, herein designated TARGET GENE. TIMM22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIMM22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIMM22 BINDING SITE, designated SEQ ID:19351, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6452] Another function of GAM47 is therefore inhibition of

Translocase of inner mitochondrial membrane 22 homolog (yeast) (TIMM22, Accession NP_037469.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM22.

[6453] Tissue inhibitor of metalloproteinase 3 (sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NP_000353.1) is another GAM47 target gene, herein designated TARGET GENE. TIMP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIMP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:11578, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6454] Another function of GAM47 is therefore inhibition of Tissue inhibitor of metalloproteinase 3 (sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NP_000353.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3.

[6455] Transmembrane 6 superfamily member 2 (TM6SF2, Ac-

cession NP_075378.1) is another GAM47 target gene, herein designated TARGET GENE. TM6SF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TM6SF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TM6SF2 BINDING SITE, designated SEQ ID:6832, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6456] Another function of GAM47 is therefore inhibition of Transmembrane 6 superfamily member 2 (TM6SF2, Accession NP_075378.1), a gene which stabilizes the aggregates of proteoglycan monomers with hyaluronic acid in the extracellular cartilage matrix. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM6SF2.

[6457] The function of TM6SF2 has been established by previous studies. By searching an EST database using TM6SF1 (OMIM Ref. No. 606562) as the probe, Carim- Todd et al. (2000) obtained a cDNA encoding TM6SF2. The deduced 351- amino acid protein, which is 52% identical to TM6SF1, has 6 transmembrane domains. By screening for

cDNAs with the potential to encode large proteins in brain, Nagase et al. (2001) identified a cDNA encoding TM6SF2, which they termed KIAA1926. KIAA1926 encodes a predicted 412- amino acid link protein, and the authors noted the existence of shorter isoforms. RT- PCR analysis detected high- level expression of KIAA1926 in adult and fetal brain, moderate expression in ovary, and low or un- detectable expression in other tissues. Within brain, ex- pression was highest in amygdala and thalamus, with high levels also detected in other brain regions.

[6458]

[6459] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6460] Nagase, T.; Kikuno, R.; Ohara, O. : Prediction of the cod- ing sequences of unidentified human genes. XXI. The complete sequences of 60 new cDNA clones from brain which code for large proteins. DNA Res. 8: 179- 187, 2001. ; and

[6461] Carim- Todd, L.; Escarceller, M.; Estivill, X.; Sumoy, L. : Cloning of the novel gene TM6SF1 reveals conservation of clusters of paralogous genes between human chromo- somes 15q24- q26 and.

[6462] Further studies establishing the function and utilities of TM6SF2 are found in John Hopkins OMIM database record ID 606563, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transmembrane protein 2 (TMEM2, Accession NP_037522.1) is another GAM47 target gene, herein designated TARGET GENE. TMEM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMEM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMEM2 BINDING SITE, designated SEQ ID:15379, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6463] Another function of GAM47 is therefore inhibition of Transmembrane protein 2 (TMEM2, Accession NP_037522.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM2.

[6464] Transmembrane, prostate androgen induced rna (TMEPAI, Accession NP_064567.2) is another GAM47 target gene, herein designated TARGET GENE. TMEPAI BINDING SITE is

a target binding site found in the 3` untranslated region of mRNA encoded by TMEPAI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:3022, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6465] Another function of GAM47 is therefore inhibition of Transmembrane, prostate androgen induced rna (TMEPAI, Accession NP_064567.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI.

[6466] TMIE (Accession NP_671729.1) is another GAM47 target gene, herein designated TARGET GENE. TMIE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMIE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMIE BINDING SITE, designated SEQ ID:7061, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6467] Another function of GAM47 is therefore inhibition of TMIE (Accession NP_671729.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMIE.

[6468] Tumor necrosis factor, alpha-induced protein 2 (TNFAIP2, Accession NP_006282.2) is another GAM47 target gene, herein designated TARGET GENE. TNFAIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFAIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFAIP2 BINDING SITE, designated SEQ ID:12369, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6469] Another function of GAM47 is therefore inhibition of Tumor necrosis factor, alpha-induced protein 2 (TNFAIP2, Accession NP_006282.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP2.

[6470] TP53BPL (Accession NP_005793.1) is another GAM47 target gene, herein designated TARGET GENE. TP53BPL BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by TP53BPL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TP53BPL BINDING SITE, designated SEQ ID:19807, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6471] Another function of GAM47 is therefore inhibition of TP53BPL (Accession NP_005793.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53BPL.

[6472] TPCN2 (Accession NP_620714.1) is another GAM47 target gene, herein designated TARGET GENE. TPCN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TPCN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPCN2 BINDING SITE, designated SEQ ID:19148, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6473] Another function of GAM47 is therefore inhibition of TPCN2 (Accession NP_620714.1) . Accordingly, utilities of

GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPCN2.

[6474] Tripartite motif-containing 29 (TRIM29, Accession NP_036233.2) is another GAM47 target gene, herein designated TARGET GENE. TRIM29 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRIM29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM29 BINDING SITE, designated SEQ ID:9558, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6475] Another function of GAM47 is therefore inhibition of Tripartite motif-containing 29 (TRIM29, Accession NP_036233.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM29.

[6476] TRIP-Br2 (Accession NP_055570.1) is another GAM47 target gene, herein designated TARGET GENE. TRIP-Br2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:4744, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6477] Another function of GAM47 is therefore inhibition of TRIP-Br2 (Accession NP_055570.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2.

[6478] Thyroid hormone receptor interactor 13 (TRIP13, Accession NP_004228.1) is another GAM47 target gene, herein designated TARGET GENE. TRIP13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIP13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIP13 BINDING SITE, designated SEQ ID:1424, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6479] Another function of GAM47 is therefore inhibition of Thyroid hormone receptor interactor 13 (TRIP13, Accession NP_004228.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TRIP13.

[6480] Tetratricopeptide repeat domain 7 (TTC7, Accession XP_031626.4) is another GAM47 target gene, herein designated TARGET GENE. TTC7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TTC7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TTC7 BINDING SITE, designated SEQ ID:14260, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6481] Another function of GAM47 is therefore inhibition of Tetratricopeptide repeat domain 7 (TTC7, Accession XP_031626.4) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC7.

[6482] TUBB5 (Accession NP_006078.2) is another GAM47 target gene, herein designated TARGET GENE. TUBB5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUBB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUBB5 BIND-

ING SITE, designated SEQ ID:15573, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6483] Another function of GAM47 is therefore inhibition of TUBB5 (Accession NP_006078.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBB5.

[6484] TXL-2 (Accession NP_835231.1) is another GAM47 target gene, herein designated TARGET GENE. TXL-2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TXL-2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TXL-2 BINDING SITE, designated SEQ ID:14725, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6485] Another function of GAM47 is therefore inhibition of TXL-2 (Accession NP_835231.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXL-2.

[6486] U1SNRNPBP (Accession NP_851030.1) is another GAM47 target gene, herein designated TARGET GENE. U1SNRNPBP

BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by U1SNRNPBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of U1SNRNPBP BINDING SITE, designated SEQ ID:19714, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6487] Another function of GAM47 is therefore inhibition of U1SNRNPBP (Accession NP_851030.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U1SNRNPBP.

[6488] U1SNRNPBP (Accession NP_851034.1) is another GAM47 target gene, herein designated TARGET GENE. U1SNRNPBP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by U1SNRNPBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of U1SNRNPBP BINDING SITE, designated SEQ ID:19714, to the nucleotide sequence of

GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6489] Another function of GAM47 is therefore inhibition of U1SNRNPBP (Accession NP_851034.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U1SNRNPBP.

[6490] U1SNRNPBP (Accession NP_073208.1) is another GAM47 target gene, herein designated TARGET GENE. U1SNRNPBP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by U1SNRNPBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of U1SNRNPBP BINDING SITE, designated SEQ ID:19714, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6491] Another function of GAM47 is therefore inhibition of U1SNRNPBP (Accession NP_073208.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U1SNRNPBP.

[6492] U1SNRNPBP (Accession NP_008951.1) is another GAM47 target gene, herein designated TARGET GENE. U1SNRNPBP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by U1SNRNPBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of U1SNRNPBP BINDING SITE, designated SEQ ID:19714, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6493] Another function of GAM47 is therefore inhibition of U1SNRNPBP (Accession NP_008951.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U1SNRNPBP.

[6494] Unc-51-like kinase 2 (c. elegans) (ULK2, Accession NP_055498.2) is another GAM47 target gene, herein designated TARGET GENE. ULK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ULK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of ULK2 BINDING SITE, designated SEQ ID:2470, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6495] Another function of GAM47 is therefore inhibition of Unc-51-like kinase 2 (c. elegans) (ULK2, Accession NP_055498.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ULK2.

[6496] Ubiquitin specific protease 4 (proto-oncogene) (USP4, Accession NP_003354.1) is another GAM47 target gene, herein designated TARGET GENE. USP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP4 BINDING SITE, designated SEQ ID:10548, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6497] Another function of GAM47 is therefore inhibition of Ubiquitin specific protease 4 (proto-oncogene) (USP4, Accession NP_003354.1), a gene which is capable of removing ubiquitin from ubiquitinated proteins. Accordingly,

utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP4.

[6498] The function of USP4 has been established by previous studies. The ubiquitin- specific proteases (UBPs) are a group of deubiquitinating enzymes that possess 2 signature motifs, the Cys box and the His box. By screening a human frontal cortex library with a Unp cDNA, Gray et al. (1995) isolated cDNAs encoding human UNP, or UNPH. The predicted protein contained both conserved UBP domains. Northern blot analysis of primary lung tumor samples indicated that levels of UNP mRNA were elevated in small cell carcinomas and adenocarcinomas relative to normal adult lung. Frederick et al. (1998) sequenced additional UNP cDNAs and found several differences from the sequence reported by Gray et al. (1995), including 2 single nucleotide insertions that increased the length of the predicted protein, UNPEL (UNP extended, long isoform), to 963 amino acids. They also recovered cDNAs encoding a shorter isoform designated UNPES. Both isoforms exhibited deubiquitinating activity. Antibodies against UNP detected 2 proteins of 105 to 110 kD on Western blots. Using immunocytochemistry of mammalian cells expressing

epitope- tagged UNP and cell fractionation studies, Frederick et al. (1998) demonstrated that both isoforms of the human protein are localized primarily in the cytosol. Northern blot analysis revealed UNP expression as a closely- migrating cluster of mRNAs in all tissues tested. However, the authors found no evidence for overexpression of UNP transcripts in cell lines derived from small cell lung carcinomas.

[6499]

[6500] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6501] Gray, D. A.; Inazawa, J.; Gupta, K.; Wong, A.; Ueda, R.; Takahashi, T. : Elevated expression of Unph, a proto-oncogene at 3p21.3, in human lung tumors. Oncogene 10: 2179- 2183, 1995. ; and

[6502] Frederick, A.; Rolfe, M.; Chiu, M. I. : The human UNP locus at 3p21.31 encodes two tissue- selective, cytoplasmic isoforms with deubiquitinating activity that have reduced expression in s.

[6503] Further studies establishing the function and utilities of USP4 are found in John Hopkins OMIM database record ID 603486, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Vang-like 2 (van gogh, drosophila) (VANGL2, Accession XP_049695.4) is another GAM47 target gene, herein designated TARGET GENE. VANGL2 BINDING SITE1 and VANGL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by VANGL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE1 and VANGL2 BINDING SITE2, designated SEQ ID:2781 and SEQ ID:20059 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6504] Another function of GAM47 is therefore inhibition of Vang-like 2 (van gogh, drosophila) (VANGL2, Accession XP_049695.4), a gene which may take part in defining the lateral boundary of floorplate differentiation and therefore may be associated with Neural tube defects. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Neural tube defects, and of other diseases and clinical conditions associated with VANGL2.

[6505] The function of VANGL2 has been established by previous studies. Murdoch et al. (2001) independently cloned the

causative gene for craniorachischisis in Lp mice, which they named Lpp1. A single base transition, 1841G- A, resulted in a ser464- to- asn substitution. Lpp1 is expressed in the ventral part of the developing neural tube, but is excluded from the floorplate where Sonic hedgehog (Shh; 600725) is expressed. Embryos lacking Shh express Lpp1 throughout the ventral neural tube, suggesting negative regulation of Lpp1 by Shh. The authors suggested that the mutual interaction between Lpp1 and Shh may define the lateral boundary of floorplate differentiation. They hypothesized that loss of Lpp1 function may disrupt neurulation by permitting more extensive floorplate induction by Shh, thereby inhibiting midline bending of the neural plate during initiation of neurulation. The human ortholog of Lpp1, which maps to chromosome 1, shares 89% identity with the mouse gene at the nucleotide level and 99% identity at the amino acid level.

[6506] Animal model experiments lend further support to the function of VANGL2. 'Loop- tail' (Lp) is a semidominant mouse mutation that, in homozygous mutants, causes a severe form of neural tube defect called craniorachischisis. Heterozygous mice exhibit a characteristic looped tail, and homozygous embryos show a completely open neural

tube in the hindbrain and spinal region. Kibar et al. (2001) used a positional cloning approach to identify the Lp gene. By an in silico search, the authors identified a mouse EST within the Lp interval homologous to a partial human cDNA clone KIAA1215. Based on its relationship to the mouse disorder, Kibar et al. (2001) used the temporary designation 'loop- tail- associated protein' (Ltap). The Ltap gene encodes a homolog of Drosophila 'strabismus/ Van Gogh' (Stbm/Vang), a component of the frizzled- dishevelled tissue polarity pathway. Ltap is expressed broadly in the neuroectoderm throughout early neurogenesis. This and the fact that the gene was altered in 2 independent Lp alleles identified it as the likely basis for loop-tail. The authors suggested that the human Ltap homolog is worthy of search for mutations that may be associated with sporadic or familial cases of neural tube defects in humans.

[6507] It is appreciated that the abovementioned animal model for VANGL2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6508] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[6509] Murdoch, J. N.; Doudney, K.; Paternotte, C.; Copp, A. J.; Stanier, P. : Severe neural tube defects in the loop- tail mouse result from mutation of Lpp1, a novel gene involved in floor plate specification. Hum. Molec. Genet. 10: 2593- 2601, 2001. ; and

[6510] Kibar, Z.; Vogan, K. J.; Groulx, N.; Justice, M. J.; Underhill, D. A.; Gros, P. : Ltap, a mammalian homolog of Drosophila Strabismus/Van Gogh, is altered in the mouse neural tube mutant lo.

[6511] Further studies establishing the function and utilities of VANGL2 are found in John Hopkins OMIM database record ID 600533, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vascular endothelial growth factor b (VEGFB, Accession NP_003368.1) is another GAM47 target gene, herein designated TARGET GENE. VEGFB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VEGFB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VEGFB BINDING SITE, designated SEQ ID:1771, to the nucleotide sequence of GAM47 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:269.

[6512] Another function of GAM47 is therefore inhibition of Vascular endothelial growth factor b (VEGFB, Accession NP_003368.1), a gene which is a growth factor for endothelial cells. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEGFB.

[6513] The function of VEGFB has been established by previous studies. Grimmond et al. (1996) cloned and characterized a member of the vascular endothelial growth factor (VEGF; 192240) gene family, which they designated VRF for VEGF- related factor. By sequencing of cDNAs from a human fetal brain library and RT- PCR products from normal and tumor tissue cDNA pools, they identified 2 alternatively spliced messages with open reading frames of 621 and 564 bp, respectively. The predicted 186- and 167- amino acid polypeptides differ at their carboxyl ends, resulting from a shift in the open reading frame. Both isoforms show strong homology to VEGF at their amino termini, but only the shorter isoform maintained homology to VEGF at its carboxyl terminus and conserved all 16 cysteine residues of the 165- amino acid form of VEGF. VRF was predicted to contain a signal peptide, suggesting to

Grimmond et al. (1996) that it may be a secreted factor. The protein coding region, spanning approximately 5 kb, is composed of 8 exons that range in size from 36 to 431 bp. Exons 6 and 7 are contiguous and the 2 isoforms of VRF arise through alternate splicing of exon 6. The investigators found that VRF is ubiquitously expressed as 2 transcripts of 2.0 and 5.5 kb and that the level of expression is similar among normal and malignant tissues.

[6514] Animal model experiments lend further support to the function of VEGFB. Bellomo et al. (2000) described the Vegfb - /- mouse. Unlike Vegfa- /- mice, which die during embryogenesis, Vegfb - /- mice are healthy and fertile. Although Vegfb - /- hearts appeared morphologically and functionally normal in unstressed mice, Bellomo et al. (2000) found that Vegfb - /- hearts were marginally smaller and displayed vascular dysfunction after coronary occlusion and impaired recovery from experimentally induced myocardial ischemia.

[6515] It is appreciated that the abovementioned animal model for VEGFB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6516] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[6517] Grimmond, S.; Lagercrantz, J.; Drinkwater, C.; Silins, G.; Townson, S.; Pollock, P.; Gotley, D.; Carson, E.; Rakar, S.; Nordenskjold, M.; Ward, L.; Hayward, N.; Weber, G. : Cloning and characterization of a novel human gene related to vascular endothelial growth factor. Genome Res. 6: 124- 131, 1996. ; and

[6518] Bellomo, D.; Headrick, J. P.; Silins, G. U.; Paterson, C. A.; Thomas, P. S.; Gartside, M.; Mould, A.; Cahill, M. M.; Tonks, I. D.; Grimmond, S. M.; Townson, S.; Wells, C.; Little, M.; Cumm.

[6519] Further studies establishing the function and utilities of VEGFB are found in John Hopkins OMIM database record ID 601398, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vasoactive intestinal peptide receptor 1 (VIPR1, Accession NP_004615.2) is another GAM47 target gene, herein designated TARGET GENE. VIPR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VIPR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of VIPR1 BINDING SITE, designated SEQ ID:10605, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6520] Another function of GAM47 is therefore inhibition of Vasoactive intestinal peptide receptor 1 (VIPR1, Accession NP_004615.2), a gene which binds vip and is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR1.

[6521] The function of VIPR1 has been established by previous studies. Vasoactive intestinal peptide (VIP; 192320) is an octacosameric neuroendocrine mediator found predominantly in cholinergic presynaptic neurons of the central nervous system and in peripheral peptidergic neurons innervating diverse tissues. Of the many neuroendocrine peptides with immunologic functions, VIP is distinguished by its capacity to affect both B and T cells directly. Distinct subsets of neural, respiratory, gastrointestinal, and immune cells bear specific high- affinity receptors for VIP, which are associated with a guanine nucleotide- binding (G) protein capable of activating adenylate cyclase. Libert et al. (1991) obtained 4 new receptors of the G protein-

coupled receptor family by selective amplification and cloning from thyroid cDNA. One of these, termed RDC1, was identified as the VIP receptor by Sreedharan et al. (1991). Libert et al. (1991) mapped the VIPR gene to 2q37 by in situ hybridization. Later information made it doubtful that the gene mapped to 2q37 was in fact the VIP receptor gene (Vassart, 1992). The sequence that was designated GPRN1 by Sreedharan et al. (1991) and mapped to 2q37 was found not to bind VIP by Wenger (1993). Sreedharan et al. (1995) isolated an authentic type I VIP receptor gene and by fluorescence in situ hybridization localized it to the 3p22 band in a region associated with small- cell lung cancer. By interspecific backcross analysis, Hashimoto et al. (1999) mapped the mouse Vipr1 gene to the distal region of chromosome 9, a region that shows homology of synteny with human chromosome 3p. Sreedharan et al. (1993) cloned a human intestinal VIP receptor gene; the deduced amino acid sequence shares 84% identity with the rat lung VIP receptor. Couvineau et al. (1994) isolated 2 VIPR cDNA clones from a human jejunal epithelial cell cDNA library. One encodes a VIP receptor consisting of 460 amino acids and having 7 putative transmembrane domains, as do other G protein- coupled

receptors. The other encodes a 495- amino acid VIP receptor- related protein exhibiting 100% homology with the functional VIP receptor over the 428 amino acids at the C- terminal region, but containing a completely divergent 67- amino acid N- terminal domain. When expressed in COS- 7 cells, the second protein did not bind radioiodinated VIP, although it was normally addressed at the plasma membrane as assessed by immunofluorescence studies.

[6522]

[6523] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6524] Sreedharan, S. P.; Huang, J.- X.; Cheung, M.- C.; Goetzl, E. J. : Structure, expression, and chromosomal localization of the type I human vasoactive intestinal peptide receptor gene. Proc. Nat. Acad. Sci. 92: 2939- 2943, 1995. ; and

[6526] Further studies establishing the function and utilities of VIPR1 are found in John Hopkins OMIM database record ID

192321, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vacuolar protein sorting 28 (yeast) (VPS28, Accession NP_057292.1) is another GAM47 target gene, herein designated TARGET GENE. VPS28 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VPS28, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS28 BINDING SITE, designated SEQ ID:1076, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6527] Another function of GAM47 is therefore inhibition of Vacuolar protein sorting 28 (yeast) (VPS28, Accession NP_057292.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS28.

[6528] Vacuolar protein sorting 4a (yeast) (VPS4A, Accession NP_037377.1) is another GAM47 target gene, herein designated TARGET GENE. VPS4A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VPS4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS4A BINDING SITE, designated SEQ ID:15139, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6529] Another function of GAM47 is therefore inhibition of Vacuolar protein sorting 4a (yeast) (VPS4A, Accession NP_037377.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS4A.

[6530] Williams-beuren syndrome chromosome region 1 (WBSCR1, Accession NP_114381.1) is another GAM47 target gene, herein designated TARGET GENE. WBSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WBSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR1 BINDING SITE, designated SEQ ID:9970, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6531] Another function of GAM47 is therefore inhibition of Williams-beuren syndrome chromosome region 1 (WBSCR1, Accession NP_114381.1), a gene which stimu-

lates protein translation and therefore may be associated with Williams syndrome. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of Williams syndrome, and of other diseases and clinical conditions associated with WBSCR1.

[6532] The function of WBSCR1 has been established by previous studies. Williams- Beuren syndrome (WBS; 194050) is a multisystem developmental disorder caused by the deletion of contiguous genes at 7q11.23. Osborne et al. (1996) characterized a 500- kb region in 7q11.23 that was deleted in a collection of 30 WBS patients. They constructed a detailed physical map of the region consisting of cosmids, P1 artificial chromosomes, and yeast artificial chromosomes. They identified 9 transcription units from the area, including the previously characterized genes ELN (OMIM Ref. No. 130160), LIMK1 (OMIM Ref. No. 601329), and RFC2 (OMIM Ref. No. 600404), and the novel genes WSCR1 and WSCR4 (OMIM Ref. No. 603432). The WSCR1 gene has 6 exons which contain an open reading frame encoding 232 amino acids, including an RNA- binding domain consensus sequence. Northern blot analysis detected a 2.5- kb WBSCR1 transcript in all human cell lines analyzed. Richter- Cook et al. (1998) identified the eukaryotic

initiation factor (EIF) 4H protein from rabbit reticulocyte lysate on the basis of its ability to stimulate translation in an in vitro globin synthesis assay deficient in EIF4B (OMIM Ref. No. 603928) and EIF4F. Amino acid sequence analysis of 3 EIF4H tryptic fragments revealed 100% sequence identity to the human WBSCR1 protein. The authors demonstrated that the 25- kD rabbit EIF4H protein stimulates the in vitro activities of EIF4B and EIF4F in globin synthesis, as well as the in vitro RNA- dependent ATPase activities of EIF4A (e.g., 601102), EIF4B, and EIF4F.

[6533]

[6534] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6544] Further studies establishing the function and utilities of WBSCR1 are found in John Hopkins OMIM database record ID 603431, and in cited publications listed in Table 5,

which are hereby incorporated by reference.WDR22 (Accession XP_031102.1) is another GAM47 target gene, herein designated TARGET GENE. WDR22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WDR22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDR22 BINDING SITE, designated SEQ ID:1630, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6545] Another function of GAM47 is therefore inhibition of WDR22 (Accession XP_031102.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR22.

[6546] WFDC13 (Accession NP_742002.1) is another GAM47 target gene, herein designated TARGET GENE. WFDC13 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by WFDC13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WFDC13 BINDING SITE, designated SEQ ID:15789, to the

nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6547] Another function of GAM47 is therefore inhibition of WFDC13 (Accession NP_742002.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WFDC13.

[6548] Xeroderma pigmentosum, complementation group c (XPC, Accession NP_004619.2) is another GAM47 target gene, herein designated TARGET GENE. XPC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by XPC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XPC BINDING SITE, designated SEQ ID:3193, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6549] Another function of GAM47 is therefore inhibition of Xeroderma pigmentosum, complementation group c (XPC, Accession NP_004619.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPC.

[6550] ZAP (Accession NP_078901.3) is another GAM47 target gene, herein designated TARGET GENE. ZAP BINDING SITE

is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ZAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZAP BINDING SITE, designated SEQ ID:2097, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6551] Another function of GAM47 is therefore inhibition of ZAP (Accession NP_078901.3) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAP.

[6552] ZAP (Accession NP_064504.2) is another GAM47 target gene, herein designated TARGET GENE. ZAP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ZAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZAP BINDING SITE, designated SEQ ID:2097, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6553] Another function of GAM47 is therefore inhibition of ZAP

(Accession NP_064504.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAP.

[6554] Zinc finger, dhhc domain containing 5 (ZDHHC5, Accession XP_290511.1) is another GAM47 target gene, herein designated TARGET GENE. ZDHHC5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZDHHC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZDHHC5 BINDING SITE, designated SEQ ID:17547, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6555] Another function of GAM47 is therefore inhibition of Zinc finger, dhhc domain containing 5 (ZDHHC5, Accession XP_290511.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC5.

[6556] Zinc finger, dhhc domain containing 6 (ZDHHC6, Accession NP_071939.1) is another GAM47 target gene, herein designated TARGET GENE. ZDHHC6 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by ZDHHC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZDHHC6 BINDING SITE, designated SEQ ID:7010, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6557] Another function of GAM47 is therefore inhibition of Zinc finger, dhhc domain containing 6 (ZDHHC6, Accession NP_071939.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC6.

[6558] ZFP1 (Accession NP_710155.1) is another GAM47 target gene, herein designated TARGET GENE. ZFP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZFP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP1 BINDING SITE, designated SEQ ID:2444, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6559] Another function of GAM47 is therefore inhibition of ZFP1

(Accession NP_710155.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP1.

[6560] ZFP29 (Accession NP_060364.1) is another GAM47 target gene, herein designated TARGET GENE. ZFP29 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFP29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP29 BINDING SITE, designated SEQ ID:6538, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6561] Another function of GAM47 is therefore inhibition of ZFP29 (Accession NP_060364.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP29.

[6562] Zinc finger protein 95 homolog (mouse) (ZFP95, Accession NP_055384.1) is another GAM47 target gene, herein designated TARGET GENE. ZFP95 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZFP95, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE, designated SEQ ID:10540, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6563] Another function of GAM47 is therefore inhibition of Zinc finger protein 95 homolog (mouse) (ZFP95, Accession NP_055384.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95.

[6564] Zinc finger protein 95 homolog (mouse) (ZFP95, Accession NP_659570.1) is another GAM47 target gene, herein designated TARGET GENE. ZFP95 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZFP95, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE, designated SEQ ID:10540, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6565] Another function of GAM47 is therefore inhibition of Zinc finger protein 95 homolog (mouse) (ZFP95, Accession

NP_659570.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95.

[6566] ZHX2 (Accession NP_055758.1) is another GAM47 target gene, herein designated TARGET GENE. ZHX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZHX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZHX2 BINDING SITE, designated SEQ ID:3967, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6567] Another function of GAM47 is therefore inhibition of ZHX2 (Accession NP_055758.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZHX2.

[6568] Zinc finger protein 137 (clone phz-30) (ZNF137, Accession NP_003429.1) is another GAM47 target gene, herein designated TARGET GENE. ZNF137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF137 BINDING SITE, designated SEQ ID:18802, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6569] Another function of GAM47 is therefore inhibition of Zinc finger protein 137 (clone phz-30) (ZNF137, Accession NP_003429.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF137.

[6570] Zinc finger protein 142 (clone phz-49) (ZNF142, Accession NP_005072.1) is another GAM47 target gene, herein designated TARGET GENE. ZNF142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF142 BINDING SITE, designated SEQ ID:4359, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6571] Another function of GAM47 is therefore inhibition of Zinc finger protein 142 (clone phz-49) (ZNF142, Accession

NP_005072.1), a gene which may be involved in transcriptional regulation. Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF142.

[6572] The function of ZNF142 has been established by previous studies. screening a human insulinoma cDNA library with a degenerate oligonucleotide corresponding to the H/C linker sequence, Tommerup et al. (1993) isolated cDNAs potentially encoding zinc finger proteins. Tommerup and Vissing (1995) performed sequence analysis on a number of these cDNAs and identified several novel zinc finger protein genes, including ZNF142. The ZNF142 cDNA predicts a protein belonging to the Kruppel family of zinc finger proteins. By sequencing random cDNAs corresponding to relatively long transcripts, Nagase et al. (1996) identified a cDNA encoding ZNF142, which they called KIAA0236. The deduced ZNF142 protein has 1,687 amino acids. Northern blot analysis detected ZNF142 expression in all 16 human tissues examined.

[6573]

[6574] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6575] Tommerup, N.; Vissing, H. : Isolation and fine mapping of 16 novel human zinc finger- encoding cDNAs identify putative candidate genes for developmental and malignant disorders. Genomics 27: 259- 264, 1995. ; and

[6576] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes.

[6577] Further studies establishing the function and utilities of ZNF142 are found in John Hopkins OMIM database record ID 604083, and in cited publications listed in Table 5, which are hereby incorporated by reference.Zinc finger protein 336 (ZNF336, Accession NP_071927.1) is another GAM47 target gene, herein designated TARGET GENE. ZNF336 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF336, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF336 BINDING SITE, designated SEQ ID:11735, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6578] Another function of GAM47 is therefore inhibition of Zinc

finger protein 336 (ZNF336, Accession NP_071927.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF336.

[6579] ZNF431 (Accession XP_086098.2) is another GAM47 target gene, herein designated TARGET GENE. ZNF431 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF431, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF431 BINDING SITE, designated SEQ ID:4664, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6580] Another function of GAM47 is therefore inhibition of ZNF431 (Accession XP_086098.2) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF431.

[6581] ZNF441 (Accession NP_689568.1) is another GAM47 target gene, herein designated TARGET GENE. ZNF441 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF441, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF441 BINDING SITE, designated SEQ ID:10390, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6582] Another function of GAM47 is therefore inhibition of ZNF441 (Accession NP_689568.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF441.

[6583] Zinc finger protein 75a (ZNF75A, Accession NP_694573.1) is another GAM47 target gene, herein designated TARGET GENE. ZNF75A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF75A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF75A BINDING SITE, designated SEQ ID:15281, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6584] Another function of GAM47 is therefore inhibition of Zinc finger protein 75a (ZNF75A, Accession NP_694573.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with ZNF75A.

[6585] Zinc finger protein 80 (pt17) (ZNF80, Accession NP_009067.1) is another GAM47 target gene, herein designated TARGET GENE. ZNF80 BINDING SITE1 and ZNF80 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ZNF80, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF80 BINDING SITE1 and ZNF80 BINDING SITE2, designated SEQ ID:3538 and SEQ ID:7656 respectively, to the nucleotide sequence of GAM47 RNA, herein designated GAM RNA, also designated SEQ ID:269.

[6586] Another function of GAM47 is therefore inhibition of Zinc finger protein 80 (pt17) (ZNF80, Accession NP_009067.1) . Accordingly, utilities of GAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF80.

[6587]

[6588] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 49 (GAM49), which modulates expression of respective target

genes thereof, the function and utility of which target genes is known in the art.

[6589] GAM49 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM49 was detected is described hereinabove with reference to Figs. 8-15.

[6590] GAM49 gene, herein designated GAM GENE, and GAM49 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[6591] GAM49 gene encodes a GAM49 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM49 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM49 precursor RNA is designated SEQ ID:184, and is provided hereinbelow with reference to the sequence listing part.

[6592] GAM49 precursor RNA folds onto itself, forming GAM49 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6593] GAM49 precursor RNA folds onto itself, forming GAM49 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[6594] Nucleotide sequence of GAM49 precursor RNA, designated SEQ-ID: 184, and a schematic representation of a predicted secondary folding of GAM49 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[6595] An enzyme complex designated DICER COMPLEX, `dices` the GAM49 folded precursor RNA into GAM49 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising

an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM49 RNA is designated SEQ ID:338, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[6596] GAM49 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM49 target RNA, herein designated GAM TARGET RNA. GAM49 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6597] GAM49 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM49 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM49 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM49 RNA may have a different number of target binding sites in untranslated regions of a GAM49 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6598] The complementary binding of GAM49 RNA, herein designated GAM RNA, to target binding sites on GAM49 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM49 target RNA into GAM49 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6599] It is appreciated that GAM49 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM49 target genes. The mRNA of each one of this plurality of GAM49 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM49 RNA, herein designated GAM RNA, and which when bound by

GAM49 RNA causes inhibition of translation of respective one or more GAM49 target proteins.

[6600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM49 gene, herein designated GAM GENE, on one or more GAM49 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6601] It is appreciated that specific functions and accordingly utilities of GAM49 correlate with, and may be deduced from, the identity of the target genes which GAM49 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6602]

[6603]

[6604] Fibroblast growth factor 18 (FGF18, Accession NM_003862.1) is a GAM49 target gene, herein designated TARGET GENE. FGF18 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FGF18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF18 BINDING SITE, designated SEQ ID:6988, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated SEQ ID:338.

[6605] A function of GAM49 is therefore inhibition of Fibroblast growth factor 18 (FGF18, Accession NM_003862.1), a gene which stimulates hepatic and intestinal proliferation. Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF18.

[6606] The function of FGF18 has been established by previous studies. The fibroblast growth factors (FGFs; e.g., FGF2; 134920) are a family of growth factors and oncogenes

that contain a conserved, approximately 120- amino acid core. Individual FGFs play important roles in embryonic development, cell growth, morphogenesis, tissue repair, inflammation, angiogenesis, and tumor growth and invasion. Ohbayashi et al. (1998) isolated human, mouse, and rat cDNAs encoding a novel member of the FGF family, FGF18. The deduced 207- amino acid human and rat FGF18 proteins are 99% identical. FGF18 contains a typical hydrophobic signal sequence at its N terminus, and the authors demonstrated that recombinant rat Fgf18 can be efficiently secreted by High Five insect cells. Recombinant rat Fgf18 induced neurite outgrowth in PC12 cells. Northern blot analysis of rat adult tissues showed abundant expression of Fgf18 in lung but did not detect Fgf18 expression in other tissues. In rat 14.5- and 19.5- day embryos, in situ hybridization showed Fgf18 expression in several discrete regions. Independently, Hu et al. (1998) isolated human and mouse FGF18 cDNAs. Among known FGF family members, the FGF18 protein is most similar to FGF8 (OMIM Ref. No. 600483) and FGF17 (OMIM Ref. No. 603725), with human FGF18 showing 60% and 58% identity with human FGF8 and FGF17, respectively. The authors demonstrated that recombinant mouse Fgf18 is gly-

cosylated and can stimulate proliferation of NIH 3T3 cells in vitro in a heparan sulfate- dependent manner. Northern blot analysis of mouse adult tissues showed highest Fgf18 expression in the lung and kidney, and in situ hybridization of mouse 15.5- day embryos detected Fgf18 transcripts primarily in the lung. However, injection of recombinant mouse Fgf18 into normal mice induced proliferation in a wide variety of tissues, with the liver and small intestine appearing to be the primary targets. Hu et al. (1998) showed that transgenic mice overexpressing Fgf18 in the liver exhibited an increase in liver weight and hepatocellular proliferation. By radiation hybrid analysis and FISH, Whitmore et al. (2000) mapped the FGF18 gene to chromosome 5q34.

[6607]

[6608] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6609] Ohbayashi, N.; Hoshikawa, M.; Kimura, S.; Yamasaki, M.; Fukui, S.; Itoh, N. : Structure and expression of the mRNA encoding a novel fibroblast growth factor, FGF- 18. J. Biol. Chem. 273: 18161- 18164, 1998. ; and

[6610] Whitmore, T. E.; Maurer, M. F.; Sexson, S.; Raymond, F.;

Conklin, D.; Deisher, T. A. : Assignment of fibroblast growth factor 18 (FGF18) to human chromosome 5q34 by use of radiation hyb.

[6611] Further studies establishing the function and utilities of FGF18 are found in John Hopkins OMIM database record ID 603726, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ13855 (Accession NM_023079.2) is another GAM49 target gene, herein designated TARGET GENE. FLJ13855 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13855, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13855 BINDING SITE, designated SEQ ID:19352, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated SEQ ID:338.

[6612] Another function of GAM49 is therefore inhibition of FLJ13855 (Accession NM_023079.2) . Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13855.

[6613] Frequently rearranged in advanced t-cell lymphomas (FRAT1, Accession NM_005479.1) is another GAM49 tar-

get gene, herein designated TARGET GENE. FRAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FRAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FRAT1 BINDING SITE, designated SEQ ID:9462, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated SEQ ID:338.

[6614] Another function of GAM49 is therefore inhibition of Frequently rearranged in advanced t-cell lymphomas (FRAT1, Accession NM_005479.1) . Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAT1.

[6615] KIAA0087 (Accession NM_014769.1) is another GAM49 target gene, herein designated TARGET GENE. KIAA0087 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:7226, to the nucleotide sequence of GAM49 RNA, herein designated

GAM RNA, also designated SEQ ID:338.

[6616] Another function of GAM49 is therefore inhibition of KIAA0087 (Accession NM_014769.1) . Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087.

[6617] KIAA1679 (Accession XM_046570.3) is another GAM49 target gene, herein designated TARGET GENE. KIAA1679 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1679, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1679 BINDING SITE, designated SEQ ID:16549, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated SEQ ID:338.

[6618] Another function of GAM49 is therefore inhibition of KIAA1679 (Accession XM_046570.3) . Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1679.

[6619] Ninjurin 2 (NINJ2, Accession NM_016533.3) is another GAM49 target gene, herein designated TARGET GENE.

NINJ2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NINJ2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NINJ2 BINDING SITE, designated SEQ ID:18923, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated SEQ ID:338.

[6620] Another function of GAM49 is therefore inhibition of Ninjurin 2 (NINJ2, Accession NM_016533.3) . Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NINJ2.

[6621] S100 calcium binding protein, beta (neural) (S100B, Accession NM_006272.1) is another GAM49 target gene, herein designated TARGET GENE. S100B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:5375, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated

SEQ ID:338.

[6622] Another function of GAM49 is therefore inhibition of S100 calcium binding protein, beta (neural) (S100B, Accession NM_006272.1), a gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B.

[6623] The function of S100B has been established by previous studies. See 176940. The beta- subunit of S100 protein is expressed in glial cells at levels at least tenfold higher than in most other cell types. The brain also contains small amounts of the alpha subunits at levels approximately one- tenth that of the beta subunit. Allore et al. (1988) used genomic and cDNA probes in connection with a panel of rodent- human somatic cell hybrids to assign the S100B gene to 21q22. They suggested that this is a candidate gene for the neurologic disturbances in Down syndrome when present in trisomic state. By in situ hybridization, Duncan et al. (1989) localized the S100B gene to 21q22.2- q22.3. Allore et al. (1990) isolated overlapping genomic clones spanning the region coding for

S100B and its flanking sequences. The intron/exon organization is similar to that of the genes coding for several other members of the S100 protein subfamily. The S100B gene is composed of 3 exons, the first of which specifies the 5- prime untranslated region. Morii et al. (1991) isolated the S100A (OMIM Ref. No. 176940) and S100B genes from a human genomic DNA library. Endonuclease mapping and DNA sequencing showed that both comprise 3 exons and 2 introns. Two Ca(2+)- binding domains were independently encoded by exons 2 and 3. By spot- blot hybridization analysis of flow- sorted chromosomes, Morii et al. (1991) showed that the S100A and S100B genes are located on chromosome 1 and chromosome 21, respectively. Using restriction endonuclease fragment length variations (RFLV) in multipoint backcrosses, Shimizu et al. (1992) mapped the S100b gene in relation to other genes on mouse chromosome 10. The S100B gene is expressed at high levels in brain primarily by astrocytes. Addition of the disulfide- bonded dimeric form of the protein to primary neuronal and glial cultures and established cell lines induces axonal extension and alterations in astrocyte proliferation and phenotype. Reeves et al. (1994) demonstrated that the same effects of the S100B protein are ex-

erted in vivo. They found that both astrocytosis and neurite proliferation occurred in transgenic mice expressing elevated levels of S100b. They suggested that these transgenic mice represent a useful model for studies of the role of S100B in glial- neuronal interactions in normal development and function of the brain and for analyzing the significance of elevated levels of the protein in Down syndrome and Alzheimer disease.

[6624]

[6625] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6626] Reeves, R. H.; Yao, J.; Crowley, M. R.; Buck, S.; Zhang, X.; Yarowsky, P.; Gearhart, J. D.; Hilt, D. C. : Astrocytosis and axonal proliferation in the hippocampus of S100b transgenic mice. Proc. Nat. Acad. Sci. 91: 5359- 5363, 1994. ; and

[6627] Shimizu, A.; Sakai, Y.; Ohno, K.; Masaki, S.; Kuwano, R.; Takahashi, Y.; Miyashita, N.; Watanabe, T. : A molecular genetic linkage map of mouse chromosome 10, including the Myb, S100b, P.

[6628] Further studies establishing the function and utilities of S100B are found in John Hopkins OMIM database record

ID 176990, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sema domain, immunoglobulin domain (ig), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 4b (SEMA4B, Accession XM_044533.9) is another GAM49 target gene, herein designated TARGET GENE. SEMA4B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SEMA4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEMA4B BINDING SITE, designated SEQ ID:17188, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated SEQ ID:338.

[6629] Another function of GAM49 is therefore inhibition of Sema domain, immunoglobulin domain (ig), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 4b (SEMA4B, Accession XM_044533.9) . Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4B.

[6630] Tumor necrosis factor receptor superfamily, member 6b, decoy (TNFRSF6B, Accession) is another GAM49 target gene, herein designated TARGET GENE. TNFRSF6B BIND-

ING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF6B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF6B BINDING SITE, designated SEQ ID:17121, to the nucleotide sequence of GAM49 RNA, herein designated GAM RNA, also designated SEQ ID:338.

[6631] Another function of GAM49 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 6b, decoy (TNFRSF6B, Accession), a gene which is decoy receptor and protects against apoptosis. Accordingly, utilities of GAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF6B.

[6632] The function of TNFRSF6B has been established by previous studies. Pitti et al. (1998) identified ESTs that showed homology to the tumor necrosis factor receptor (TNFR) superfamily. Using PCR with primers based on the region of EST consensus, they isolated a cDNA encoding a soluble decoy receptor, termed decoy receptor- 3 (DCR3), from a human fetal lung cDNA library. The DCR3 protein contains 300 amino acids and has a molecular mass of 35 kD. By Northern blot analysis, Pitti et al. (1998) detected a

1.2- kb transcript in human fetal lung, brain, and liver, and in adult spleen, colon, and lung. Pitti et al. (1998) demonstrated that DCR3 binds to FASL and inhibits FASL-induced apoptosis. Like osteoprotegerin (OPG; 602643), another TNFR superfamily member, DCR3 lacks an apparent transmembrane sequence, indicating that DCR3 may be a secreted, rather than a membrane- associated, molecule. The DCR3 protein shares 31% sequence homology with OPG, and all of the cysteines in the 4 cysteine-rich domains of DCR3 and OPG are conserved. Pitti et al. (1998) stated that DCR3 and OPG define a subset of TNFR family members that function as secreted decoys to modulate ligands that induce apoptosis. Bai et al. (2000) independently identified the DCR3 gene, which they called M68. M68 genomic DNA, mRNA, and protein levels were examined in a series of human gastrointestinal tract tumors. Using M68 immunohistochemistry and a scoring system similar to that used for HER- 2/neu (ERBB2; 164870), they found that M68 protein was overexpressed in 30 of 68 (44%) human adenocarcinomas of the esophagus, stomach, colon, and rectum. Tumors examined by Northern blot revealed M68 mRNA highly elevated in a similar fraction of primary tumors from the same gas-

trointestinal tract regions, as well as in 2 colon adenocarcinoma cell lines. They also found M68 protein to be overexpressed in a substantial number of tumors in which gene amplification could not be detected by fluorescence in situ hybridization or quantitative genomic PCR, suggesting that overexpression of M68 may precede amplification in tumors. They found that M68 lies within a 4-gene cluster that includes a novel helicase- like gene related to RAD3/ERCC2 (OMIM Ref. No. 126340), a plasma membrane Ras- related GTPase and a member of the stathmin family (OMIM Ref. No. 151442), amplification or overexpression of which may also contribute to cell growth and tumor progression.

[6633]

[6634] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6635] Bai, C.; Connolly, B.; Metzker, M. L.; Hilliard, C. A.; Liu, X.; Sandig, V.; Soderman, A.; Galloway, S. M.; Liu, Q.; Austin, C. P.; Caskey, C. T. : Overexpression of M68/DCR3 in human gastrointestinal tract tumors independent of gene amplification and its location in a four- gene cluster. Proc. Nat. Acad. Sci. 97: 1230- 1235, 2000. ; and

[6636] Pitti, R. M.; Marsters, S. A.; Lawrence, D. A.; Roy, M.; Kischkel, F. C.; Dowd, P.; Huang, A.; Donahue, C. J.; Sherwood, S. W.; Baldwin, D. T.; Godowski, P. J.; Wood, W. I.; Gurney, A.

[6637] Further studies establishing the function and utilities of TNFRSF6B are found in John Hopkins OMIM database record ID 603361, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[6638] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 50 (GAM50), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6639] GAM50 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM50 was detected is described hereinabove with reference to Figs. 8-15.

[6640] GAM50 gene, herein designated GAM GENE, and GAM50 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[6641] GAM50 gene encodes a GAM50 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA

genes, and unlike most ordinary genes, GAM50 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM50 precursor RNA is designated SEQ ID:150, and is provided hereinbelow with reference to the sequence listing part.

[6642] GAM50 precursor RNA folds onto itself, forming GAM50 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6643] GAM50 precursor RNA folds onto itself, forming GAM50 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nu-

cleotide sequence of the second half thereof.

[6644] Nucleotide sequence of GAM50 precursor RNA, designated SEQ-ID: 150, and a schematic representation of a predicted secondary folding of GAM50 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[6645] An enzyme complex designated DICER COMPLEX, `dices` the GAM50 folded precursor RNA into GAM50 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM50 RNA is designated SEQ ID:368, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[6646] GAM50 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM50 target RNA, herein designated GAM TARGET RNA. GAM50 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein

coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6647] GAM50 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM50 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM50 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM50 RNA may have a different number of target binding sites in untranslated regions of a GAM50 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6648] The complementary binding of GAM50 RNA, herein designated GAM RNA, to target binding sites on GAM50 target

RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM50 target RNA into GAM50 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6649] It is appreciated that GAM50 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM50 target genes. The mRNA of each one of this plurality of GAM50 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM50 RNA, herein designated GAM RNA, and which when bound by GAM50 RNA causes inhibition of translation of respective one or more GAM50 target proteins.

[6650] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM50 gene, herein designated GAM GENE, on one or more GAM50 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the

known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6651] It is appreciated that specific functions and accordingly utilities of GAM50 correlate with, and may be deduced from, the identity of the target genes which GAM50 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6652]

[6653]

[6654] LOC85028 (Accession NM_053040.1) is a GAM50 target gene, herein designated TARGET GENE. LOC85028 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC85028, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC85028 BINDING SITE, designated SEQ ID:11482, to the

nucleotide sequence of GAM50 RNA, herein designated GAM RNA, also designated SEQ ID:368.

[6655] A function of GAM50 is therefore inhibition of LOC85028 (Accession NM_053040.1) . Accordingly, utilities of GAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85028.

[6656]

[6657] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 51 (GAM51), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6658] GAM51 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM51 was detected is described hereinabove with reference to Figs. 8-15.

[6659] GAM51 gene, herein designated GAM GENE, and GAM51 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[6660] GAM51 gene encodes a GAM51 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA

genes, and unlike most ordinary genes, GAM51 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM51 precursor RNA is designated SEQ ID:49, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:49 is located at position 70576684 relative to chromosome 7.

[6661] GAM51 precursor RNA folds onto itself, forming GAM51 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6662] GAM51 precursor RNA folds onto itself, forming GAM51 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[6663] Nucleotide sequence of GAM51 precursor RNA, designated SEQ-ID: 49, and a schematic representation of a predicted secondary folding of GAM51 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[6664] An enzyme complex designated DICER COMPLEX, `dices` the GAM51 folded precursor RNA into GAM51 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM51 RNA is designated SEQ ID:201, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[6665] GAM51 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM51 target RNA, herein designated GAM TARGET RNA. GAM51 target RNA comprises three regions, as is typical of mRNA of a

protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6666] GAM51 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM51 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM51 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM51 RNA may have a different number of target binding sites in untranslated regions of a GAM51 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6667] The complementary binding of GAM51 RNA, herein desig-

nated GAM RNA, to target binding sites on GAM51 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM51 target RNA into GAM51 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6668] It is appreciated that GAM51 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM51 target genes. The mRNA of each one of this plurality of GAM51 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM51 RNA, herein designated GAM RNA, and which when bound by GAM51 RNA causes inhibition of translation of respective one or more GAM51 target proteins.

[6669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM51 gene, herein designated GAM GENE, on one or more GAM51 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6670] It is appreciated that specific functions and accordingly utilities of GAM51 correlate with, and may be deduced from, the identity of the target genes which GAM51 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6671]

[6672]

[6673] Atp-binding cassette, sub-family d (ald), member 4 (ABCD4, Accession NM_020323.1) is a GAM51 target gene, herein designated TARGET GENE. ABCD4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCD4 BINDING SITE, designated SEQ ID:1712, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6674] A function of GAM51 is therefore inhibition of Atp-binding cassette, sub-family d (ald), member 4 (ABCD4, Accession NM_020323.1), a gene which Putative peroxisomal ATP binding cassette transporter. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD4.

[6675] The function of ABCD4 has been established by previous studies. The peroxisomal membrane contains several ATP- binding cassette (ABC) transporters, including PMP70 (PXMP1; 170995), ALDP (see OMIM Ref. No. 300100), and ALDR (ALDL1; 601081). All 3 proteins are ABC half- transporters, which dimerize to form an active transporter. See 603076. By searching an EST database for homologs of PMP70 and ALDP, Shani et al. (1997) and Holzinger et al. (1997) identified PXMP1L cDNAs. They respectively designated the gene P70R and PMP69. Shani et al. (1997) reported that the predicted 606- amino acid protein has the structure of an ABC half- transporter and

shares 25 to 27% sequence identity with PMP70, ALDR, and ALDP. Antibodies against PXMP1L detected a 73- kD protein on Western blots. Immunofluorescence studies localized the protein to peroxisomes. Northern blot analysis revealed that PXMP1L was expressed as a 2.6- kb mRNA in all tissues examined. Holzinger et al. (1997) and Holzinger et al. (1998) found transcript variants resulting from alternative splicing and use of alternative polyadenylation sites. Holzinger et al. (1998) reported that the PXMP1L gene contains 19 exons and spans approximately 16 kb.

[6676]

[6677] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6678] Holzinger, A.; Roscher, A. A.; Landgraf, P.; Lichtner, P.; Kammerer, S. : Genomic organization and chromosomal localization of the human peroxisomal membrane protein- 1- like protein (PXMP1- L) gene encoding a peroxisomal ABC transporter. FEBS Lett. 426: 238- 242, 1998. ; and

[6679] Shani, N.; Jimenez- Sanchez, G.; Steel, G.; Dean, M.; Valle, D. : Identification of a fourth half ABC transporter in the

human peroxisomal membrane. Hum. Molec. Genet. 6: 1925- 1931, 1997.

[6680] Further studies establishing the function and utilities of ABCD4 are found in John Hopkins OMIM database record ID 603214, and in cited publications listed in Table 5, which are hereby incorporated by reference.Acyl-coenzyme a dehydrogenase family, member 8 (ACAD8, Accession NM_014384.1) is another GAM51 target gene, herein designated TARGET GENE. ACAD8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACAD8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACAD8 BINDING SITE, designated SEQ ID:1175, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6681] Another function of GAM51 is therefore inhibition of Acyl-coenzyme a dehydrogenase family, member 8 (ACAD8, Accession NM_014384.1), a gene which Member of the acyl- Coenzyme A dehydrogenase family; alpha,beta- dehydrogenates acyl- CoA esters. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ACAD8.

[6682] The function of ACAD8 has been established by previous studies. Acyl- coenzyme A (CoA) dehydrogenases (ACADs) are a family of mitochondrial enzymes that catalyze the first dehydrogenation step in the beta- oxidation of fatty acyl- CoA derivatives. Fatty acids provide important respiratory fuel for many tissues, including heart, skeletal muscle, brown adipose tissue, kidney, and liver, as is evident in individuals with defects in any 1 of the ACADs. The mitochondrial beta- oxidation pathway is a cycle of 4 sequential reactions in which the fatty acid substrate is shortened by 2 carbon atoms with each cycle, releasing an acetyl- CoA molecule that can then be used in the tricarboxylic acid cycle or for ketogenesis. Several human ACADs exist, including those involved in the initial step of mitochondrial beta- oxidation of straight chain fatty acids, such as short- chain ACAD (ACADS; 606885), medium- chain ACAD (ACADM; 607008), long- chain ACAD (ACADL; 201460), and very long- chain ACAD (ACADVL; 201475), and those involved in the degradation of amino acids, such as isovaleryl- CoA dehydrogenase (IVD; 243500), isobutyryl- CoA dehydrogenase, and glutaryl- CoA dehydrogenase (GCDH; 231670). All ACADs

catalyze the same initial dehydrogenation of the substrate at the beta- carbon atom and require electron transfer flavoprotein as an electron acceptor. However, they differ distinctly from each other with regard to the length and configuration of the hydrocarbon chain of their respective substrates and have accordingly received appropriate names. ACADs are nuclear- encoded and are synthesized as precursor proteins in the cytosol with an N- terminal leader peptide, which is cleaved off on import to the mitochondria, producing a mature monomer. ACADs share sequence similarity. By constructing a transcript map of the HJCD (OMIM Ref. No. 602782) critical region in 11q25, together with searching the Unigene database, Telford et al. (1999) identified the ACAD8 gene. They isolated an ACAD8 cDNA containing a full- length coding sequence using RT- PCR on RNA from human adult brain and skin fibroblast. The predicted 415- amino acid ACAD8 protein contains many of the residues conserved in most other ACADs, including an active site glutamic acid residue and residues important for tetramer formation. Amino acid sequence identity between ACAD8 and other known ACADs range from 28% with GCDH to 38% with ACADS. Northern blot analysis detected an approximately 2.1- kb ACAD8

transcript in all tissues examined, namely heart, lung, brain, skeletal muscle, pancreas, placenta, liver, and kidney, although it was weakly expressed in the last 2 tissues. RT- PCR showed ACAD8 expression in human cochlea and the myeloid cell line KG- 1. Andresen et al. (2000) showed that ACAD8 is an isobutyryl- CoA dehydrogenase and that both ACAD8 and ACADSB are imported in the mitochondria and form tetramers. ACAD8 is a mitochondrial enzyme that functions in valine catabolism.

[6683]

[6684] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6685] Telford, E. A. R.; Moynihan, L. M.; Markham, A. F.; Lench, N. J. : Isolation and characterisation of a cDNA encoding the precursor for a novel member of the acyl- CoA dehydrogenase gene family. Biochim. Biophys. Acta 1446: 371- 376, 1999. ; and

[6687] Further studies establishing the function and utilities of ACAD8 are found in John Hopkins OMIM database record ID 604773, and in cited publications listed in Table 5, which are hereby incorporated by reference.Acidic (leucine-rich) nuclear phosphoprotein 32 family, member a (ANP32A, Accession NM_006305.2) is another GAM51 target gene, herein designated TARGET GENE. ANP32A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ANP32A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANP32A BINDING SITE, designated SEQ ID:9401, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6688] Another function of GAM51 is therefore inhibition of Acidic (leucine-rich) nuclear phosphoprotein 32 family, member a (ANP32A, Accession NM_006305.2), a gene which may play a role in a signal transduction pathway that directs differentiation of cerebellar neurons. and therefore may be associated with Acute myeloid leukemia. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of Acute myeloid leukemia, and of

other diseases and clinical conditions associated with ANP32A.

[6689] The function of ANP32A has been established by previous studies. Fink et al. (1995) mapped the PHAP1 gene to 15q22.3- q23 by fluorescence in situ hybridization. The similarities between PHAP I and SET suggested to the authors that the PHAP1 gene might also form a fusion protein with CAN. In the SET- CAN fusion gene, the breakpoint is located 3- prime of the SET gene, but the last exon of SET is removed in the fusion transcript. This exon encodes the last 7 amino acids (EDEGEDD) of SET that are identical with the end of PHAP I except that PHAP I carries an additional D (EDEGEDDD). The vast majority of cases in which CAN is involved in acute myeloid leukemia show a specificity for the t(6;9) translocation (Sandberg et al., 1983) that fuses the 3- prime part of the CAN gene on 9q34 (von Lindern et al., 1990) to almost the complete coding region of the DEK gene (OMIM Ref. No. 125264) on 6p23 (von Lindern et al., 1992). The translocation breakpoints always occur in intron icb- 9 of CAN. The PHAP1/CAN translocation would be expected to cause acute leukemia. Like DEK and SET, PHAP I contains an extended acidic region that could result in a transforming

capacity. Mutation in ataxin- 1 (ATX1; 601556) causes spinocerebellar ataxia (SCA1; 164400). Using a yeast 2-hybrid screen of a mouse brain cDNA library with mutant human ATX1 as bait, Matilla et al. (1997) isolated a mouse cDNA encoding Lanp, which is 89% identical to the human protein and is expressed in cerebellum and brainstem. Binding analysis indicated that the strongest interaction between the proteins is with the N- terminal 147 residues on Lanp, which contain 5 leucine- rich repeats, and a full-length ataxin- 1 containing 82 glutamines. Immunohistochemical analysis demonstrated highest levels of Lanp, like Atx1, in the nuclei of cerebellar Purkinje cells

[6690]

[6691] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

with t(6;9)(p23;q34): a specific subgroup of AML? Cancer Genet. Cytogenet.

[6694] Further studies establishing the function and utilities of ANP32A are found in John Hopkins OMIM database record ID 600832, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adaptor-related protein complex 4, sigma 1 subunit (AP4S1, Accession NM_007077.2) is another GAM51 target gene, herein designated TARGET GENE. AP4S1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AP4S1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP4S1 BINDING SITE, designated SEQ ID:13777, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6695] Another function of GAM51 is therefore inhibition of Adaptor-related protein complex 4, sigma 1 subunit (AP4S1, Accession NM_007077.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP4S1.

[6696] Aquaporin 6, kidney specific (AQP6, Accession

NM_053286.1) is another GAM51 target gene, herein designated TARGET GENE. AQP6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by AQP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:17661, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6697] Another function of GAM51 is therefore inhibition of Aquaporin 6, kidney specific (AQP6, Accession NM_053286.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6.

[6698] The function of AQP6 has been established by previous studies. Ma et al. (1997), who referred to this gene as aquaporin- 6 (AQP6), demonstrated that, among the 7 human aquaporins cloned to that time (AQPs 0 to 6), the genes encoding the 4 most closely related aquaporins all

mapped to 12q13: AQP0, AQP2, AQP5 (OMIM Ref. No. 600442), and AQP6. To construct a physical map and identify novel aquaporin gene members of this cluster, Ma et al. (1997) screened a human CEPH B YAC library by PCR using primers derived from exon 4 of the AQP2 and AQP0 genes. A YAC clone with 200 kb of human DNA was isolated an analyzed. Primary pulsed field gel electrophoresis and Southern blot analysis indicated the presence of AQP2, AQP5, and AQP6 genes, but not AQP0. Restriction mapping and PCR analysis yielded a precise physical map in which the 3 aquaporin genes spanned only approximately 27 kb with the order, transcription orientation, and spacer length as follows: 5- prime- - AQP2- - 5kb spacer- - AQP5- - 7kb spacer- - AQP6- - 3- prime. Yasui et al. (1999) showed that AQP6 is localized exclusively in intracellular membranes in renal epithelia. Sequential ultracentrifugation of rat kidney homogenates confirmed that AQP6 resides predominantly in vesicular fractions, and immunohistochemical and immunoelectron microscopic studies confirmed that more than 98% of AQP6 is located in intracellular membrane vesicles. In glomeruli, AQP6 is present in membrane vesicles within podocyte cell bodies and foot processes. In proximal tubules, AQP6

is also abundant in membrane vesicles within the subapical compartment of segment 2 and segment 3 cells, but was not detected in the brush border or basolateral membranes. In collecting duct, AQP6 resides in intracellular membrane vesicles in apical, mid, and basolateral cytoplasm of type A intercalated cells, but was not observed in the plasma membrane. Unlike other members of the AQP family, the unique distribution in intracellular membrane vesicles in multiple types of renal epithelia indicated that AQP6 is not simply involved in transcellular fluid absorption. These studies predicted that AQP6 participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism.

[6699]

[6700] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6701] Ma, T.; Yang, B.; Umenishi, F.; Verkman, A. S. : Closely spaced tandem arrangement of AQP2, AQP5, and AQP6 genes in a 27- kilobase segment at chromosome locus 12q13. Genomics 43: 387- 389, 1997. ; and

[6702] Yasui, M.; Kwon, T.- H.; Knepper, M. A.; Nielsen, S.; Agre, P. : Aquaporin- 6: an intracellular vesicle water channel

protein in renal epithelia. Proc. Nat. Acad. Sci. 96: 5808-5813, 1999.

[6703] Further studies establishing the function and utilities of AQP6 are found in John Hopkins OMIM database record ID 601383, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atpase, na+/k+ transporting, alpha 2 (+) polypeptide (ATP1A2, Accession NM_000702.1) is another GAM51 target gene, herein designated TARGET GENE. ATP1A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:15415, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6704] Another function of GAM51 is therefore inhibition of Atpase, na+/k+ transporting, alpha 2 (+) polypeptide (ATP1A2, Accession NM_000702.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2.

[6705] Bone morphogenetic protein 1 (BMP1, Accession

NM_006128.1) is another GAM51 target gene, herein designated TARGET GENE. BMP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMP1 BINDING SITE, designated SEQ ID:4998, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6706] Another function of GAM51 is therefore inhibition of Bone morphogenetic protein 1 (BMP1, Accession NM_006128.1), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1.

[6707] The function of BMP1 has been established by previous studies. The BMP1 locus encodes a protein that is capable of inducing formation of cartilage in vivo (Wozney et al., 1988). Although other bone morphogenetic proteins are members of the TGF- beta (OMIM Ref. No. 190180) superfamily, BMP1 encodes a novel protein that is not closely related to other known growth factors. Kessler et

al. (1996) showed that recombinantly expressed BMP1 and purified procollagen C proteinase (PCP), a secreted metalloprotease requiring calcium and needed for cartilage and bone formation, are, in fact, identical. PCP cleaves the C-terminal propeptides of procollagen I (OMIM Ref. No. 120150), II (OMIM Ref. No. 120140), and III (OMIM Ref. No. 120180) and its activity is increased by the procollagen C- endopeptidase enhancer protein (OMIM Ref. No. 600270). Reddi (1996) discussed the significance of the finding that BMP1 is the same as procollagen C- proteinase.

[6708]

[6709] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6712] Further studies establishing the function and utilities of

BMP1 are found in John Hopkins OMIM database record ID 112264, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome 14 open reading frame 1 (C14orf1, Accession NM_007176.1) is another GAM51 target gene, herein designated TARGET GENE. C14orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:19752, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6713] Another function of GAM51 is therefore inhibition of Chromosome 14 open reading frame 1 (C14orf1, Accession NM_007176.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1.

[6714] Chromosome 20 open reading frame 82 (C20orf82, Accession XM_097736.3) is another GAM51 target gene, herein designated TARGET GENE. C20orf82 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf82, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf82 BINDING SITE, designated SEQ ID:2115, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6715] Another function of GAM51 is therefore inhibition of Chromosome 20 open reading frame 82 (C20orf82, Accession XM_097736.3) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf82.

[6716] Chemokine (c-c motif) receptor 5 (CCR5, Accession NM_000579.1) is another GAM51 target gene, herein designated TARGET GENE. CCR5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCR5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:15737, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6717] Another function of GAM51 is therefore inhibition of Chemokine (c-c motif) receptor 5 (CCR5, Accession

NM_000579.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5.

[6718] Centaurin, delta 2 (CENTD2, Accession NM_139181.1) is another GAM51 target gene, herein designated TARGET GENE. CENTD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CENTD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENTD2 BINDING SITE, designated SEQ ID:11402, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6719] Another function of GAM51 is therefore inhibition of Centaurin, delta 2 (CENTD2, Accession NM_139181.1), a gene which involved in cell signaling/communication. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD2.

[6720] The function of CENTD2 has been established by previous studies. Miura et al. (2002) examined ARAP1 as a possible link between phosphoinositide-, ARF-, and RHO- medi-

ated cell signaling. In vitro, ARAP1 had RHO- GAP and phosphatidylinositol (3,4,5) trisphosphate (PIP3; OMIM Ref. No. 171834)- dependent ARF- GAP activity. ARAP1 associated with the Golgi. The RHO- GAP activity mediated cell rounding and loss of stress fibers when ARAP1 was overexpressed. The ARF- GAP activity mediated changes in the Golgi apparatus and the formation of filopodia, the latter a consequence of increased cellular activity of CDC42 (OMIM Ref. No. 116952). The ARF- GAP and RHO-GAP activities both contributed to inhibiting cell spreading. Thus, ARAP1 is a PIP3- dependent ARF- GAP that regulates ARF-, RHO-, and CDC42- dependent cell activities.

[6721]

[6722] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

genes. XI. The.

[6725] Further studies establishing the function and utilities of CENTD2 are found in John Hopkins OMIM database record ID 606646, and in cited publications listed in Table 5, which are hereby incorporated by reference.Corticotropin releasing hormone receptor 2 (CRHR2, Accession NM_001883.1) is another GAM51 target gene, herein designated TARGET GENE. CRHR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRHR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRHR2 BINDING SITE, designated SEQ ID:3504, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6726] Another function of GAM51 is therefore inhibition of Corticotropin releasing hormone receptor 2 (CRHR2, Accession NM_001883.1), a gene which is a corticotropin releasing factor receptor type II. and therefore may be associated with Anxiety. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of Anxiety, and of other diseases and clinical conditions associated with CRHR2.

[6727] The function of CRHR2 has been established by previous studies. Corticotropin- releasing hormone (CRH; 122560) is a 41- amino acid peptide synthesized in the hypothalamus. It is the principal neuroregulator of the hypothalamic- pituitary- adrenocortical axis and plays an important role in coordinating the endocrine, autonomic, and behavioral responses to stress and immune challenge. Liaw et al. (1996) stated that there are 2 G protein- coupled CRH receptors, CRHR1 (OMIM Ref. No. 122561) and CRHR2, which they termed the CRF2 receptor. The investigators used clones of the rat CRF2 receptor to isolate the human gene from brain and kidney genomic DNA libraries. The gene consists of 12 exons spanning approximately 30 kb. The predicted protein, which is 411 amino acids in length and 70% identical to the CRF1 receptor, contains a putative N- terminal secretory signal sequence and 7 putative transmembrane domains. Liaw et al. (1996) expressed the CRF2 receptor and found that transfected cells responded to the binding of CRH with an increase in intracellular cAMP. Although the rat receptor has 2 alternatively spliced variants, termed CRF2- alpha and CRF2- beta, Liaw et al. (1996) found no evidence for alternative splicing of the human receptor. Liaw et al. (1996) reported that the phar-

macologic profile of this protein was similar to that of the rat CRF2- alpha protein but distinct from the human CRF1 receptor Kostich et al. (1998) reported a novel CRHR2 splice isoform, which they referred to as 'CRF2- gamma,' found in human brain. CRF2- gamma cDNA encodes a 397- amino acid receptor containing an amino terminus with no significant homology to the already reported alpha- and beta- termini. PCR and Southern blot analysis of CRF2- gamma RNA expression in human brain detected expression in the septum and hippocampus, with weaker but detectable expression in the amygdala, nucleus accumbens, midbrain, and frontal cortex.

[6728] Animal model experiments lend further support to the function of CRHR2. Kishimoto et al. (2000) generated mice deficient for Crhr2 by targeted disruption. They reported that male but not female Crhr2- deficient mice exhibited enhanced anxious behavior in several tests of anxiety in contrast to mice lacking Crhr1. The enhanced anxiety of Crhr2- deficient mice was not due to changes in hypothalamic- pituitary- adrenal axis activity, but rather reflected impaired responses in specific brain regions involved in emotional and autonomic functions, as monitored by a reduction in Creb phosphorylation in male, but not female,

Crhr2 - /- mice. Kishimoto et al. (2000) proposed that CRHR1 predominantly mediates a central anxiolytic response, opposing the general anxiogenic effect of CRH mediated by CRHR1. Kishimoto et al. (2000) found that neither male nor female Crhr2- deficient mice showed alterations of baseline feeding behavior. Both responded with increased edema formation in response to thermal exposure, however, indicating that in contrast to its central role in anxiety, the peripheral role of CRHR2 in vascular permeability is independent of gender.

[6729] It is appreciated that the abovementioned animal model for CRHR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6730] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6731] Kostich, W. A.; Chen, A.; Sperle, K.; Largent, B. L. : Molecular identification and analysis of a novel human corticotropin- releasing factor (CRF) receptor: the CRF2-gamma receptor. Molec. Endocr. 12: 1077- 1085, 1998. ; and

[6733] Further studies establishing the function and utilities of CRHR2 are found in John Hopkins OMIM database record ID 602034, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cytochrome p450, subfamily ivf, polypeptide 2 (CYP4F2, Accession NM_001082.3) is another GAM51 target gene, herein designated TARGET GENE. CYP4F2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP4F2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP4F2 BINDING SITE, designated SEQ ID:7657, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6734] Another function of GAM51 is therefore inhibition of Cytochrome p450, subfamily ivf, polypeptide 2 (CYP4F2, Accession NM_001082.3) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F2.

[6735] DKFZp434M0331 (Accession NM_017600.1) is another GAM51 target gene, herein designated TARGET GENE. DK-FZp434M0331 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZp434M0331, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434M0331 BINDING SITE, designated SEQ ID:2188, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6736] Another function of GAM51 is therefore inhibition of DK-FZp434M0331 (Accession NM_017600.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434M0331.

[6737] DKFZp761B0514 (Accession NM_032289.1) is another GAM51 target gene, herein designated TARGET GENE. DK-FZp761B0514 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZp761B0514, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:17559, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6738] Another function of GAM51 is therefore inhibition of DKFZp761B0514 (Accession NM_032289.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B0514.

[6739] Dentatorubral-pallidoluysian atrophy (atrophin-1) (DRPLA, Accession NM_001940.2) is another GAM51 target gene, herein designated TARGET GENE. DRPLA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DRPLA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRPLA BINDING SITE, designated SEQ ID:17538, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6740] Another function of GAM51 is therefore inhibition of Dentatorubral-pallidoluysian atrophy (atrophin-1) (DRPLA, Accession NM_001940.2) . Accordingly, utilities of GAM51

include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRPLA.

[6741] FLJ10450 (Accession NM_018095.2) is another GAM51 target gene, herein designated TARGET GENE. FLJ10450 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10450 BINDING SITE, designated SEQ ID:8966, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6742] Another function of GAM51 is therefore inhibition of FLJ10450 (Accession NM_018095.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10450.

[6743] FLJ13693 (Accession NM_024807.1) is another GAM51 target gene, herein designated TARGET GENE. FLJ13693 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13693, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ13693 BINDING SITE, designated SEQ ID:8310, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6744] Another function of GAM51 is therefore inhibition of FLJ13693 (Accession NM_024807.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13693.

[6745] FLJ13940 (Accession) is another GAM51 target gene, herein designated TARGET GENE. FLJ13940 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13940, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13940 BINDING SITE, designated SEQ ID:4113, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6746] Another function of GAM51 is therefore inhibition of FLJ13940 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13940.

[6747] FLJ14146 (Accession NM_024709.1) is another GAM51 target gene, herein designated TARGET GENE. FLJ14146

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:14366, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6748] Another function of GAM51 is therefore inhibition of FLJ14146 (Accession NM_024709.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146.

[6749] FLJ20508 (Accession NM_017850.1) is another GAM51 target gene, herein designated TARGET GENE. FLJ20508 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20508, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20508 BINDING SITE, designated SEQ ID:13954, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6750] Another function of GAM51 is therefore inhibition of

FLJ20508 (Accession NM_017850.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508.

[6751] FLJ25193 (Accession NM_144985.1) is another GAM51 target gene, herein designated TARGET GENE. FLJ25193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25193 BINDING SITE, designated SEQ ID:11138, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6752] Another function of GAM51 is therefore inhibition of FLJ25193 (Accession NM_144985.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25193.

[6753] Gaba(a) receptor-associated protein like 1 (GABARAPL1, Accession NM_031412.1) is another GAM51 target gene, herein designated TARGET GENE. GABARAPL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GABARAPL1, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:11020, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6754] Another function of GAM51 is therefore inhibition of Gaba(a) receptor-associated protein like 1 (GABARAPL1, Accession NM_031412.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1.

[6755] Guanine nucleotide binding protein (g protein), beta polypeptide 2 (GNB2, Accession NM_005273.2) is another GAM51 target gene, herein designated TARGET GENE. GNB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNB2 BINDING SITE, designated SEQ ID:818, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6756] Another function of GAM51 is therefore inhibition of Guanine nucleotide binding protein (g protein), beta polypep-

tide 2 (GNB2, Accession NM_005273.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB2.

[6757] HEMK (Accession NM_016173.1) is another GAM51 target gene, herein designated TARGET GENE. HEMK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:12563, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6758] Another function of GAM51 is therefore inhibition of HEMK (Accession NM_016173.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK.

[6759] Human immunodeficiency virus type i enhancer binding protein 2 (HIVEP2, Accession NM_006734.2) is another GAM51 target gene, herein designated TARGET GENE. HIVEP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIVEP2, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIVEP2 BINDING SITE, designated SEQ ID:1152, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6760] Another function of GAM51 is therefore inhibition of Human immunodeficiency virus type i enhancer binding protein 2 (HIVEP2, Accession NM_006734.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIVEP2.

[6761] HN1L (Accession NM_144570.1) is another GAM51 target gene, herein designated TARGET GENE. HN1L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HN1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HN1L BINDING SITE, designated SEQ ID:14161, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6762] Another function of GAM51 is therefore inhibition of HN1L

(Accession NM_144570.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HN1L.

[6763] Heterogeneous nuclear ribonucleoprotein k (HNRPK, Accession NM_031262.1) is another GAM51 target gene, herein designated TARGET GENE. HNRPK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNRPK BINDING SITE, designated SEQ ID:19122, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6764] Another function of GAM51 is therefore inhibition of Heterogeneous nuclear ribonucleoprotein k (HNRPK, Accession NM_031262.1), a gene which play a role in the nuclear metabolism of hnrnas, particularly for pre- mrnas that contain cytidine- rich sequence. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPK.

[6765] The function of HNRPK has been established by previous studies. The hnRNP- K family of acidic nuclear proteins

have been identified using a monoclonal antibody that distinguishes between quiescent and proliferating human keratinocytes. The family, which is composed of at least 4 major proteins (e.g.: 164017, 600124, 164020, and HN-RPD) and their modified forms, is present in similar overall levels in quiescent and proliferating normal keratinocytes, although clear differences were observed in levels of some of the individual variants. Using a monoclonal antibody as a probe, Dejgaard et al. (1994) cloned a cDNA coding for type B hnRNP- K, and this was used to screen for additional family members. Sequencing of positive clones revealed 4 alternative splicing variants of a gene that mapped to chromosome 9 (by Southern blot analysis of human/rodent somatic cell hybrids). The hnRNP- K protein has been implicated in pre- mRNA metabolism of transcripts containing cytidine- rich sequences, and the results of Dejgaard et al. (1994) point toward a role in cell cycle progression. Tommerup and Leffers (1996) mapped HNRNPK to 9q21.32- q21.33 by fluorescence in situ hybridization.

[6766]

[6767] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[6768] Dejgaard, K.; Leffers, H.; Rasmussen, H. H.; Madsen, P.; Kruse, T. A.; Gesser, B.; Nielsen, H.; Celis, J. E. : Identification, molecular cloning, expression and chromosome mapping of a family of transformation upregulated hnRNP- K proteins derived by alternative splicing. J. Molec. Biol. 236: 33- 48, 1994. ; and

[6769] Tommerup, N.; Leffers, H. : Assignment of human KH-box- containing genes by in situ hybridization: HNRNPK maps to 9q21.32- q21.33, PCBP1 to 2p12- p13, and PCBP2 to 12q13.12- q13.13, distal to F.

[6770] Further studies establishing the function and utilities of HNRPK are found in John Hopkins OMIM database record ID 600712, and in cited publications listed in Table 5, which are hereby incorporated by reference.Homeo box d4 (HOXD4, Accession NM_014621.2) is another GAM51 target gene, herein designated TARGET GENE. HOXD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXD4 BINDING SITE, designated SEQ ID:16160, to the

nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6771] Another function of GAM51 is therefore inhibition of Homeo box d4 (HOXD4, Accession NM_014621.2), a gene which is part of a developmental regulatory system. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD4.

[6772] The function of HOXD4 has been established by previous studies. See HOXD3 (OMIM Ref. No. 142980). The homologous mouse gene was at first designated a Hox- 5 gene. HOX4 genes, other than the one subsequently designated HOX4A, were initially considered to be members of a different cluster of genes called HOX5. Oliver et al. (1989) found by study of interspecific somatic cell hybrids that the cluster of so- called HOX5 genes map to human chromosome 2. By in situ hybridization, they found that the localization was 2q31- q32 with a peak of grains at 2q32.3. This gene is also called HOXD4, as a member of the HOXD gene cluster on 2q31. Mavilio et al. (1986) described the HOXD4 gene, but designated it homeo box X. Northern blot analysis detected multiple embryonic transcripts, which were differentially expressed in spinal cord,

brain, backbone rudiments, limb buds, and heart in 5- to 9- week- old human embryos and fetuses in a striking organ- and stage- specific pattern. On the basis of these observations, Mavilio et al. (1986) suggested that in early mammalian development, homeo box genes may exert a wide spectrum of control functions in a variety of organs and body parts in addition to the spinal cord.

[6773]

[6774] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6775] Mavilio, F.; Simeone, A.; Giampaolo, A.; Faiella, A.; Zappavigna, V.; Acampora, D.; Poiana, G.; Russo, G.; Peschle, C.; Boncinelli, E. : Differential and stage- related expression in embryonic tissues of a new human homoeobox gene. Nature 324: 664- 668, 1986. ; and

[6776] Oliver, G.; Sidell, N.; Fiske, W.; Heinzmann, C.; Mohandas, T.; Sparkes, R. S.; De Robertis, E. M. : Complementary homeo protein gradients in developing limb buds. Genes Dev. 3: 641- 650.

[6777] Further studies establishing the function and utilities of HOXD4 are found in John Hopkins OMIM database record ID 142981, and in cited publications listed in Table 5,

which are hereby incorporated by reference.HPIP (Accession NM_020524.2) is another GAM51 target gene, herein designated TARGET GENE. HPIP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HPIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPIP BINDING SITE, designated SEQ ID:13420, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6778] Another function of GAM51 is therefore inhibition of HPIP (Accession NM_020524.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPIP.

[6779] Integrin, alpha m (complement component receptor 3, alpha; also known as cd11b (p170), macrophage antigen alpha polypeptide) (ITGAM, Accession NM_000632.2) is another GAM51 target gene, herein designated TARGET GENE. ITGAM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITGAM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of ITGAM BINDING SITE, designated SEQ ID:2813, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6780] Another function of GAM51 is therefore inhibition of Integrin, alpha m (complement component receptor 3, alpha; also known as cd11b (p170), macrophage antigen alpha polypeptide) (ITGAM, Accession NM_000632.2), a gene which is invovled in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement- coated particles. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAM.

[6781] The function of ITGAM has been established by previous studies. A major surface antigen family on human leukocytes includes complement receptor type 3 (CR3A; also called integrin alpha- M, Mac1 or Mo1), lymphocyte function- associated antigen type 1 (LFA- 1; 153370), and p150,95 (Leu M5; 151510). These antigens share a common beta chain (OMIM Ref. No. 116920) of 94 kD, linked noncovalently to 1 of 3 alpha chains distinctive to each. They promote adhesion of granulocytes to each other and

to endothelial cell monolayers. The apparent molecular weight of the Mo1 alpha chain is 155 to 165 kD, that of the LFA1 alpha subunit is 180 kD, and that of the Leu M5 subunit is 130 to 150 kD. Pierce et al. (1986) purified human Mo1 to homogeneity from normal granulocytes by affinity chromatography and high performance liquid chromatography (HPLC) and determined the N- terminal amino acid sequence of its alpha subunit. The obtained sequence was identical, except for 2 conservative substitutions, to that of the alpha subunit of Mac1 antigen (Springer et al., 1985). Furthermore, Pierce et al. (1986) found that the N- terminal amino acid sequence of the alpha subunit of Mo1 was homologous to the alpha subunit of IIb/IIIa, a glycoprotein that serves similar adhesive functions on platelets and is deficient or defective in Glanzmann thrombasthenia (OMIM Ref. No. 273800). Patients with a history of recurrent bacterial infections and an inherited deficiency of all 3 leukocyte membrane surface antigens are thought to have reduced or absent synthesis of the common beta subunit of the antigen family; see 116920. By Southern analysis of DNA from hamster-human hybrids, Arnaout et al. (1988) localized the human MO1A gene to chromosome 16, which has been shown to

contain the gene LFA1A (OMIM Ref. No. 153370). By in situ hybridization, Corbi et al. (1988) demonstrated that the alpha subunits of LFA- 1, Mac1, and p150,95 constitute a cluster that might be called leukocyte adhesion, alpha, cluster (LAAC) located on 16p13.1- p11. Callen et al. (1991) narrowed the assignment to 16p11.2. Inflammation plays an essential role in the initiation and progression of atherosclerosis. Simon et al. (2000) presented evidence that it also has a role in vascular repair after mechanical arterial injury (i.e., percutaneous transluminal coronary angioplasty, or PTCA). In animal models of vascular injury, leukocytes are recruited as a precursor to intimal thickening. Markers of leukocyte activation, in particular, increased expression of Mac1, which is responsible for firm leukocyte adhesion to platelets and fibrinogen on denuded vessels, predict restenosis after PTCA. To determine whether Mac1- mediated leukocyte recruitment is causally related to neointimal formation, Simon et al. (2000) subjected Mac1 knockout mice to a mechanical carotid artery dilation and complete endothelial denudation. They found that the selective absence of Mac1 impaired transplatelet leukocyte migration into the vessel wall, reducing leukocyte accumulation. Diminished medial

leukocyte accumulation was accompanied by markedly reduced neointimal thickening after vascular injury. These data established a role for inflammation in neointimal thickening and suggested that leukocyte recruitment to mechanically injured arteries may prevent restenosis

[6782]

[6783] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6784] Pierce, M. W.; Remold- O'Donnell, E.; Todd, R. F., III; Arnaout, M. A. : N- terminal sequence of human leukocyte glycoprotein Mo1: conservation across species and homology to platelet IIb/IIIa. Biochim. Biophys. Acta 874: 368- 371, 1986. ; and

[6785] Arnaout, M. A.; Remold- O'Donnell, E.; Pierce, M. W.; Harris, P.; Tenen, D. G. : Molecular cloning of the alpha- subunit of human and guinea pig leukocyte adhesion glycoprotein Mo1: chromo.

[6786] Further studies establishing the function and utilities of ITGAM are found in John Hopkins OMIM database record ID 120980, and in cited publications listed in Table 5, which are hereby incorporated by reference.Jerky homolog-like (mouse) (JRKL, Accession NM_003772.2) is an-

other GAM51 target gene, herein designated TARGET GENE. JRKL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JRKL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JRKL BINDING SITE, designated SEQ ID:8555, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6787] Another function of GAM51 is therefore inhibition of Jerky homolog-like (mouse) (JRKL, Accession NM_003772.2), a gene which is a Jerky- related protein and similar to centromere binding protein- B and other nuclear regulators and therefore may be associated with Seizures. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of Seizures, and of other diseases and clinical conditions associated with JRKL.

[6788] The function of JRKL has been established by previous studies. Toth et al. (1995) found that inactivation of the mouse 'jerky' gene results in epileptic seizures. See 603210. Zeng et al. (1997) identified a human tonsil cDNA encoding a protein similar to jerky. They designated the predicted 442- amino acid protein HHMJG (human ho-

molog of mouse jerky gene). The HHMJG and mouse jerky proteins are 35% identical. Northern blot analysis revealed that HHMJG is abundantly expressed as a 4- kb mRNA in various tissues. In testis, an additional 2- kb transcript is present. By fluorescence in situ hybridization, Zeng et al. (1997) mapped the HHMJG gene to 11q21.

[6789]

[6790] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6793] Further studies establishing the function and utilities of JRKL are found in John Hopkins OMIM database record ID 603211, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0010

(Accession NM_014671.1) is another GAM51 target gene, herein designated TARGET GENE. KIAA0010 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0010, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0010 BINDING SITE, designated SEQ ID:10549, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6794] Another function of GAM51 is therefore inhibition of KIAA0010 (Accession NM_014671.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0010.

[6795] KIAA0427 (Accession NM_014772.1) is another GAM51 target gene, herein designated TARGET GENE. KIAA0427 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0427, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:20045, to the

nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6796] Another function of GAM51 is therefore inhibition of KIAA0427 (Accession NM_014772.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427.

[6797] KIAA0445 (Accession NM_014675.1) is another GAM51 target gene, herein designated TARGET GENE. KIAA0445 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0445, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0445 BINDING SITE, designated SEQ ID:15553, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6798] Another function of GAM51 is therefore inhibition of KIAA0445 (Accession NM_014675.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0445.

[6799] KIAA0775 (Accession) is another GAM51 target gene,

herein designated TARGET GENE. KIAA0775 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0775, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0775 BINDING SITE, designated SEQ ID:17868, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6800] Another function of GAM51 is therefore inhibition of KIAA0775 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0775.

[6801] KIAA1374 (Accession XM_028413.6) is another GAM51 target gene, herein designated TARGET GENE. KIAA1374 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1374, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1374 BINDING SITE, designated SEQ ID:15843, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6802] Another function of GAM51 is therefore inhibition of KIAA1374 (Accession XM_028413.6) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1374.

[6803] KIAA1500 (Accession) is another GAM51 target gene, herein designated TARGET GENE. KIAA1500 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1500, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:16249, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6804] Another function of GAM51 is therefore inhibition of KIAA1500 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500.

[6805] KIAA1573 (Accession XM_031545.5) is another GAM51 target gene, herein designated TARGET GENE. KIAA1573 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1573, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1573 BINDING SITE, designated SEQ ID:4415, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6806] Another function of GAM51 is therefore inhibition of KIAA1573 (Accession XM_031545.5) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1573.

[6807] KIAA1649 (Accession) is another GAM51 target gene, herein designated TARGET GENE. KIAA1649 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1649, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:819, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6808] Another function of GAM51 is therefore inhibition of KIAA1649 (Accession) . Accordingly, utilities of GAM51

include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649.

[6809] LOC131583 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC131583 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131583, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131583 BINDING SITE, designated SEQ ID:4254, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6810] Another function of GAM51 is therefore inhibition of LOC131583 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131583.

[6811] LOC145951 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC145951 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145951, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC145951 BINDING SITE, designated SEQ ID:16078, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6812] Another function of GAM51 is therefore inhibition of LOC145951 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145951.

[6813] LOC145990 (Accession XM_085289.4) is another GAM51 target gene, herein designated TARGET GENE. LOC145990 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145990, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145990 BINDING SITE, designated SEQ ID:14131, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6814] Another function of GAM51 is therefore inhibition of LOC145990 (Accession XM_085289.4) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145990.

[6815] LOC146108 (Accession) is another GAM51 target gene,

herein designated TARGET GENE. LOC146108 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146108, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146108 BINDING SITE, designated SEQ ID:13023, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6816] Another function of GAM51 is therefore inhibition of LOC146108 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146108.

[6817] LOC147229 (Accession XM_085742.2) is another GAM51 target gene, herein designated TARGET GENE. LOC147229 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147229, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:12528, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6818] Another function of GAM51 is therefore inhibition of LOC147229 (Accession XM_085742.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147229.

[6819] LOC149386 (Accession XM_097631.1) is another GAM51 target gene, herein designated TARGET GENE. LOC149386 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149386, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149386 BINDING SITE, designated SEQ ID:4322, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6820] Another function of GAM51 is therefore inhibition of LOC149386 (Accession XM_097631.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149386.

[6821] LOC151040 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC151040 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC151040, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151040 BINDING SITE, designated SEQ ID:16461, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6822] Another function of GAM51 is therefore inhibition of LOC151040 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151040.

[6823] LOC151438 (Accession XM_098060.1) is another GAM51 target gene, herein designated TARGET GENE. LOC151438 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151438, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:5376, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6824] Another function of GAM51 is therefore inhibition of LOC151438 (Accession XM_098060.1) . Accordingly, utili-

ties of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438.

[6825] LOC158402 (Accession XM_098936.1) is another GAM51 target gene, herein designated TARGET GENE. LOC158402 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158402, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:10627, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6826] Another function of GAM51 is therefore inhibition of LOC158402 (Accession XM_098936.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402.

[6827] LOC162461 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC162461 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC162461, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162461 BINDING SITE, designated SEQ ID:4357, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6828] Another function of GAM51 is therefore inhibition of LOC162461 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162461.

[6829] LOC200220 (Accession XM_114157.1) is another GAM51 target gene, herein designated TARGET GENE. LOC200220 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:14994, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6830] Another function of GAM51 is therefore inhibition of LOC200220 (Accession XM_114157.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200220.

[6831] LOC220431 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC220431 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220431, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220431 BINDING SITE, designated SEQ ID:7875, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6832] Another function of GAM51 is therefore inhibition of LOC220431 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220431.

[6833] LOC255189 (Accession XM_172929.2) is another GAM51 target gene, herein designated TARGET GENE. LOC255189 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255189, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255189 BINDING SITE, designated SEQ ID:6202, to

the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6834] Another function of GAM51 is therefore inhibition of LOC255189 (Accession XM_172929.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255189.

[6835] LOC255650 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC255650 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255650, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255650 BINDING SITE, designated SEQ ID:16025, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6836] Another function of GAM51 is therefore inhibition of LOC255650 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255650.

[6837] LOC256158 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC256158 BINDING

SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:5147, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6838] Another function of GAM51 is therefore inhibition of LOC256158 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158.

[6839] LOC256536 (Accession NM_174937.1) is another GAM51 target gene, herein designated TARGET GENE. LOC256536 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256536, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256536 BINDING SITE, designated SEQ ID:410, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6840] Another function of GAM51 is therefore inhibition of

LOC256536 (Accession NM_174937.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256536.

[6841] LOC256733 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC256733 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256733, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256733 BINDING SITE, designated SEQ ID:18655, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6842] Another function of GAM51 is therefore inhibition of LOC256733 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256733.

[6843] LOC91133 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC91133 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91133 BINDING SITE, designated SEQ ID:2831, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6844] Another function of GAM51 is therefore inhibition of LOC91133 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91133.

[6845] LOC91351 (Accession) is another GAM51 target gene, herein designated TARGET GENE. LOC91351 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91351, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:9849, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6846] Another function of GAM51 is therefore inhibition of LOC91351 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91351.

[6847] Lymphotoxin alpha (tnf superfamily, member 1) (LTA, Accession NM_000595.2) is another GAM51 target gene, herein designated TARGET GENE. LTA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LTA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTA BINDING SITE, designated SEQ ID:19202, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6848] Another function of GAM51 is therefore inhibition of Lymphotoxin alpha (tnf superfamily, member 1) (LTA, Accession NM_000595.2), a gene which is a cytokine that in its homotrimeric form binds to tnfrsf1a/tnfr1, tnfrsf1b/tnfbr and tnfrsf14/hvem. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTA.

[6849] The function of LTA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.MGC10715 (Accession NM_024325.3) is another GAM51 target gene, herein designated TARGET GENE. MGC10715 BINDING SITE is a target binding site

found in the 3` untranslated region of mRNA encoded by MGC10715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:17807, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6850] Another function of GAM51 is therefore inhibition of MGC10715 (Accession NM_024325.3) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715.

[6851] MGC10986 (Accession NM_030576.2) is another GAM51 target gene, herein designated TARGET GENE. MGC10986 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10986, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10986 BINDING SITE, designated SEQ ID:13552, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6852] Another function of GAM51 is therefore inhibition of MGC10986 (Accession NM_030576.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10986.

[6853] MGC15873 (Accession NM_032920.1) is another GAM51 target gene, herein designated TARGET GENE. MGC15873 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15873, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15873 BINDING SITE, designated SEQ ID:6309, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6854] Another function of GAM51 is therefore inhibition of MGC15873 (Accession NM_032920.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15873.

[6855] MGC16142 (Accession NM_032763.1) is another GAM51 target gene, herein designated TARGET GENE. MGC16142 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by MGC16142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16142 BINDING SITE, designated SEQ ID:15996, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6856] Another function of GAM51 is therefore inhibition of MGC16142 (Accession NM_032763.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16142.

[6857] MGC5356 (Accession NM_024059.2) is another GAM51 target gene, herein designated TARGET GENE. MGC5356 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC5356, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC5356 BINDING SITE, designated SEQ ID:5507, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6858] Another function of GAM51 is therefore inhibition of

MGC5356 (Accession NM_024059.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5356.

[6859] Machado-joseph disease (spinocerebellar ataxia 3, olivopontocerebellar ataxia 3, autosomal dominant, ataxin 3) (MJD, Accession NM_030660.1) is another GAM51 target gene, herein designated TARGET GENE. MJD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MJD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MJD BINDING SITE, designated SEQ ID:19294, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6860] Another function of GAM51 is therefore inhibition of Machado-joseph disease (spinocerebellar ataxia 3, olivopontocerebellar ataxia 3, autosomal dominant, ataxin 3) (MJD, Accession NM_030660.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MJD.

[6861] Otoferlin (OTOF, Accession NM_004802.1) is another

GAM51 target gene, herein designated TARGET GENE. OTOF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OTOF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OTOF BINDING SITE, designated SEQ ID:6635, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6862] Another function of GAM51 is therefore inhibition of Otoferlin (OTOF, Accession NM_004802.1), a gene which is involved in vesicle membrane fusion and required for inner ear function. and therefore may be associated with Deafness. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of Deafness, and of other diseases and clinical conditions associated with OTOF.

[6863] The function of OTOF has been established by previous studies. Using a candidate gene approach, Yasunaga et al. (1999) identified a novel human gene, which they called OTOF, mutation in which causes DFNB9 (OMIM Ref. No. 601071). DFNB9 had been linked to chromosome 2p23.1, between D2S2303 and D2S174. Yasunaga et al. (1999) refined the interval to a 1- cM interval between D2S158 and

D2S174. A contig of YACs, BACs, and PACs was constructed, and 2 genes, HADHB and CENPA, and 4 ESTs were assigned to the interval. The genes were excluded as candidates for DFNB9 by function. The ESTs were submitted to rounds of 5- prime RACE- PCR and the deduced amino acids were compared with clones isolated from 2 subtracted mouse cochlear cDNA libraries. The human OTOF gene encodes a 4,954- bp transcript with a 3,690- bp open reading frame and a 1,038- bp 3- prime untranslated region with a polyadenylation signal at position 4934. The 1,230- amino acid protein has a calculated molecular mass of 140.5 kD. It has 3 C2 domains and a single carboxy- terminal transmembrane domain. The protein is homologous to the C. elegans spermatogenesis factor FER- 1 and human dysferlin (OMIM Ref. No. 603009), prompting the authors to name it 'otoferlin.' The homology suggests the otoferlin is involved in vesicle membrane fusion. The OTOF gene extends over 21 kb and contains 28 coding exons and a 5- prime untranslated region exon. Otof expression was identified by RT- PCR in mouse cochlea, vestibule, and brain. By in situ hybridization, Otof labeling was seen in the inner hair cells, and faintly in the outer hair cells and spiral ganglion cells, at

embryonic day 19.5, P0, and P2. Neuroepithelia of the utricle, saccule, and semicircular canals expressed Otof during the same days. Type I cells, but not type II cells or supporting cells, expressed Otof. By Northern blot analysis, Yasunaga et al. (2000) detected a 7- kb otoferlin mRNA in the human brain. They isolated a corresponding cDNA, which was predicted to encode a 1,977- long form of otoferlin with 6 C2 domains. They found that the human OTOF gene contains 48 coding exons and spans approximately 90 kb. Other alternatively spliced transcripts were detected, which predicted several long isoforms (with 6 C2 domains) in humans and mice and short isoforms (3 C2 domains) only in humans. Yasunaga et al. (2000) studied a consanguineous family originating from India in which 3 sibs suffered from severe to profound hearing loss. By segregation analysis with polymorphic markers of the DFNB9 chromosomal region, they concluded that an OTOF mutation was likely to underlie deafness in this family. By sequencing the 48 OTOF coding exons in members of this family, they identified a splice mutation in intron 8 (603681.0002). These studies demonstrated that the long otoferlin isoforms are By Northern blot analysis, Yasunaga et al. (2000) detected a

7- kb otoferlin mRNA in the human brain. They isolated a corresponding cDNA, which was predicted to encode a 1,977- long form of otoferlin with 6 C2 domains. They found that the human OTOF gene contains 48 coding exons and spans approximately 90 kb. Other alternatively spliced transcripts were detected, which predicted several long isoforms (with 6 C2 domains) in humans and mice and short isoforms (3 C2 domains) only in humans. Yasunaga et al. (2000) studied a consanguineous family originating from India in which 3 sibs suffered from severe to profound hearing loss. By segregation analysis with polymorphic markers of the DFNB9 chromosomal region, they concluded that an OTOF mutation was likely to underlie deafness in this family. By sequencing the 48 OTOF coding exons in members of this family, they identified a splice mutation in intron 8 (603681.0002). These studies demonstrated that the long otoferlin isoforms are required for inner ear function.

[6864]

[6865] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6866] Yasunaga, S.; Grati, M.; Chardenoux, S.; Smith, T. N.;

Friedman, T. B.; Lalwani, A. K.; Wilcox, E. R.; Petit, C. : OTOF encodes multiple long and short isoforms: genetic evidence that the long ones underlie recessive deafness DFNB9. Am. J. Hum. Genet. 67: 591- 600, 2000. ; and

[6867] Yasunaga, S.; Grati, M.; Cohen- Salmon, M.; El- Amraoui, A.; Mustapha, M.; Salem, N.; El- Zir, E.; Loiselet, J.; Petit, C. : A mutation in OTOF, encoding otoferlin, a FER- 1- like protein, c.

[6868] Further studies establishing the function and utilities of OTOF are found in John Hopkins OMIM database record ID 603681, and in cited publications listed in Table 5, which are hereby incorporated by reference.PAG (Accession NM_018440.2) is another GAM51 target gene, herein designated TARGET GENE. PAG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAG BINDING SITE, designated SEQ ID:8895, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6869] Another function of GAM51 is therefore inhibition of PAG (Accession NM_018440.2) . Accordingly, utilities of

GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAG.

[6870] PATE (Accession NM_138294.1) is another GAM51 target gene, herein designated TARGET GENE. PATE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PATE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PATE BINDING SITE, designated SEQ ID:11458, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6871] Another function of GAM51 is therefore inhibition of PATE (Accession NM_138294.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PATE.

[6872] PP1057 (Accession NM_031285.1) is another GAM51 target gene, herein designated TARGET GENE. PP1057 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PP1057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PP1057

BINDING SITE, designated SEQ ID:461, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6873] Another function of GAM51 is therefore inhibition of PP1057 (Accession NM_031285.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1057.

[6874] Protein phosphatase 1, regulatory (inhibitor) subunit 12b (PPP1R12B, Accession NM_032105.1) is another GAM51 target gene, herein designated TARGET GENE. PPP1R12B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPP1R12B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R12B BINDING SITE, designated SEQ ID:7244, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6875] Another function of GAM51 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 12b (PPP1R12B, Accession NM_032105.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PPP1R12B.

[6876] PRO0659 (Accession NM_014138.1) is another GAM51 target gene, herein designated TARGET GENE. PRO0659 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0659, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0659 BINDING SITE, designated SEQ ID:4863, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6877] Another function of GAM51 is therefore inhibition of PRO0659 (Accession NM_014138.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0659.

[6878] Protein tyrosine phosphatase, receptor type, n polypeptide 2 (PTPRN2, Accession NM_130842.1) is another GAM51 target gene, herein designated TARGET GENE. PTPRN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of PTPRN2 BINDING SITE, designated SEQ ID:19987, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6879] Another function of GAM51 is therefore inhibition of Protein tyrosine phosphatase, receptor type, n polypeptide 2 (PTPRN2, Accession NM_130842.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN2.

[6880] RGL (Accession NM_015149.2) is another GAM51 target gene, herein designated TARGET GENE. RGL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGL BINDING SITE, designated SEQ ID:20166, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6881] Another function of GAM51 is therefore inhibition of RGL (Accession NM_015149.2), a gene which is involved in nucleotide exchange factor. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGL.

[6882] The function of RGL has been established by previous studies. Ral guanine nucleotide dissociation stimulator (RALGDS; 601619) and its family members are involved in Ras and Ral signaling pathways as downstream effector proteins. While transcript mapping the 1q25 region in an attempt to identify the HPC1 (OMIM Ref. No. 601518) gene, Sood et al. (2000) cloned a cDNA encoding RGL, which is 94% identical to the mouse Rgl protein, and a splice variant. The deduced 803- amino acid brain isoform, which is identical to the KIAA0959 protein isolated by Nagase et al. (1999), differs from the 768- amino acid liver isoform due to the substitution of 44 residues for the first 9 residues of the liver protein. The divergence results from the use of alternative first exons. Exon- trap and sequence analyses determined that the RGL gene contains 18 exons. The proteins both contain a CDC25 (OMIM Ref. No. 157680)- like domain and a Ras- interacting domain. Northern blot analysis revealed ubiquitous expression of a 5.0- kb transcript, with an additional 5.3- kb transcript in brain. Using RT- PCR analysis, Nagase et al. (1999) found strong expression in most tissues and all brain regions tested. By radiation hybrid analysis, Nagase et al. (1999) mapped the RGL gene to chromosome 1.

[6883]

[6884] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6885] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hirosawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XIII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 6: 63- 70, 1999. ; and

[6886] Sood, R.; Makalowska, I.; Carpten, J. D.; Robbins, C. M.; Stephan, D. A.; Connors, T. D.; Morgenbesser, S. D.; Su, K.; Pinkett, H. W.; Graham, C. L.; Quesenberry, M. I.; Baxevanis, A. D.

[6887] Further studies establishing the function and utilities of RGL are found in John Hopkins OMIM database record ID 605667, and in cited publications listed in Table 5, which are hereby incorporated by reference.RoXaN (Accession NM_017590.4) is another GAM51 target gene, herein designated TARGET GENE. RoXaN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RoXaN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:16809, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6888] Another function of GAM51 is therefore inhibition of RoXaN (Accession NM_017590.4) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN.

[6889] SCYD1 (Accession) is another GAM51 target gene, herein designated TARGET GENE. SCYD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCYD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:18728, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6890] Another function of GAM51 is therefore inhibition of SCYD1 (Accession) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYD1.

[6891] Solute carrier family 2 (facilitated glucose transporter), member 1 (SLC2A1, Accession NM_006516.1) is another

GAM51 target gene, herein designated TARGET GENE. SLC2A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A1 BINDING SITE, designated SEQ ID:17243, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6892] Another function of GAM51 is therefore inhibition of Solute carrier family 2 (facilitated glucose transporter), member 1 (SLC2A1, Accession NM_006516.1) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A1.

[6893] Stomatin (epb72)-like 1 (STOML1, Accession NM_004809.2) is another GAM51 target gene, herein designated TARGET GENE. STOML1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STOML1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STOML1 BINDING SITE, desig-

nated SEQ ID:17548, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6894] Another function of GAM51 is therefore inhibition of Stomatin (epb72)-like 1 (STOML1, Accession NM_004809.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STOML1.

[6895] TUSP (Accession NM_020245.2) is another GAM51 target gene, herein designated TARGET GENE. TUSP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:12909, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6896] Another function of GAM51 is therefore inhibition of TUSP (Accession NM_020245.2) . Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP.

[6897] Ubiquitin-conjugating enzyme e2i (ubc9 homolog, yeast)

(UBE2I, Accession NM_003345.1) is another GAM51 target gene, herein designated TARGET GENE. UBE2I BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by UBE2I, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2I BINDING SITE, designated SEQ ID:17025, to the nucleotide sequence of GAM51 RNA, herein designated GAM RNA, also designated SEQ ID:201.

[6898] Another function of GAM51 is therefore inhibition of Ubiquitin-conjugating enzyme e2i (ubc9 homolog, yeast) (UBE2I, Accession NM_003345.1), a gene which catalyzes the covalent attachment of ubiquitin- like protein sumo-1 to other proteins. Accordingly, utilities of GAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2I.

[6899] The function of UBE2I has been established by previous studies. The ubiquitin- conjugating enzymes (E2s) are a family of proteins involved in the ubiquitin- dependent protein degradation system. In yeast, at least 10 different E2s have been identified; they are involved in essential cellular processes such as DNA repair, cell cycle control,

and stress responses. Using the yeast 2- hybrid system with the repressor domain of the Wilms tumor gene product (WT1; 607102) as bait, Wang et al. (1996) isolated a cDNA encoding a human homolog of the yeast ubiquitin-conjugating enzyme 9 (UBC9). Sequencing of human UBC9 revealed that it has 56% identity with yeast ubc9 and contains the active site cysteine residue necessary for the ubiquitin- conjugating activity of all E2 enzymes. Wang et al. (1996) found that human UBC9 could fully complement the mutant phenotype of a yeast ubc9 mutant strain. Northern blot analysis revealed human UBC9 transcripts of 4.4, 2.4, and 1.3 kb in all of the tissues examined. In yeast, ubc9 is involved in cell cycle progression via degradation of cyclins (see OMIM Ref. No. 123835). Wang et al. (1996) suggested that human UBC9 (also symbolized UBE2I) may play a similar role via interaction with WT1, which is able to impose a block to cell cycle progression in eukaryotic cells. Fragile histidine triad (FHIT; 601153), a candidate tumor suppressor gene located on 3p14.2, is deleted in many types of human cancer. Using a yeast 2-hybrid screen to search for proteins that interact with the FHIT protein in vivo, Shi et al. (2000) found that UBC9 is specifically associated with FHIT. The last 21 amino acids

at the C terminus of UBC9 appear to be unimportant for its biologic activity, since a UBC9 mutant harboring a deletion of these amino acids could still restore normal growth of yeast containing a temperature- sensitive mutation in the homolog UBC9 gene. Mutational analysis indicated that UBC9 was associated with the C- terminal portion of FHIT. The interaction between FHIT and UBC9 appeared to be independent of the enzymatic activity of FHIT. Given that yeast UBC9 is involved in the degradation of S- and M- phase cyclins, Shi et al. (2000) concluded that FHIT may be involved in cell cycle control through its interaction with UBC9.

[6900]

[6901] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6902] Wang, Z.- Y.; Qiu, Q.- Q.; Seufert, W.; Taguchi, T.; Testa, J. R.; Whitmore, S. A.; Callen, D. F.; Welsh, D.; Shenk, T.; Deuel, T. F. : Molecular cloning of the cDNA and chromosome localization of the gene for human ubiquitin- conjugating enzyme 9. J. Biol. Chem. 271: 24811- 24816, 1996. ; and

[6903] Shi, Y.; Zou, M.; Farid, N. R.; Paterson, M. C. : Association

of FHIT (fragile histidine triad), a candidate tumour suppressor gene, with the ubiquitin- conjugating enzyme hUBC9. Biochem.

[6904] Further studies establishing the function and utilities of UBE2I are found in John Hopkins OMIM database record ID 601661, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[6905] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 52 (GAM52), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6906] GAM52 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM52 was detected is described hereinabove with reference to Figs. 8-15.

[6907] GAM52 gene, herein designated GAM GENE, and GAM52 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[6908] GAM52 gene encodes a GAM52 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM52 precursor

RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM52 precursor RNA is designated SEQ ID:39, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:39 is located at position 2480402 relative to chromosome 6.

[6909] GAM52 precursor RNA folds onto itself, forming GAM52 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6910] GAM52 precursor RNA folds onto itself, forming GAM52 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nu-

cleotide sequence of the second half thereof.

[6911] Nucleotide sequence of GAM52 precursor RNA, designated SEQ-ID: 39, and a schematic representation of a predicted secondary folding of GAM52 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[6912] An enzyme complex designated DICER COMPLEX, `dices` the GAM52 folded precursor RNA into GAM52 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM52 RNA is designated SEQ ID:373, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[6913] GAM52 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM52 target RNA, herein designated GAM TARGET RNA. GAM52 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein

coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6914] GAM52 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM52 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM52 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM52 RNA may have a different number of target binding sites in untranslated regions of a GAM52 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6915] The complementary binding of GAM52 RNA, herein designated GAM RNA, to target binding sites on GAM52 target

RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM52 target RNA into GAM52 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6916] It is appreciated that GAM52 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM52 target genes. The mRNA of each one of this plurality of GAM52 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM52 RNA, herein designated GAM RNA, and which when bound by GAM52 RNA causes inhibition of translation of respective one or more GAM52 target proteins.

[6917] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM52 gene, herein designated GAM GENE, on one or more GAM52 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the

known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6918] It is appreciated that specific functions and accordingly utilities of GAM52 correlate with, and may be deduced from, the identity of the target genes which GAM52 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6919]

[6920]

[6921] Gap junction protein, alpha 5, 40kda (connexin 40) (GJA5, Accession NM_005266.3) is a GAM52 target gene, herein designated TARGET GENE. GJA5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GJA5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GJA5 BINDING SITE, designated

SEQ ID:15528, to the nucleotide sequence of GAM52 RNA, herein designated GAM RNA, also designated SEQ ID:373.

[6922] A function of GAM52 is therefore inhibition of Gap junction protein, alpha 5, 40kda (connexin 40) (GJA5, Accession NM_005266.3), a gene which may facilitate cardiac impulse conduction. Accordingly, utilities of GAM52 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA5.

[6923] The function of GJA5 has been established by previous studies. See 121011 for a general discussion of the connexin gene family. Kanter et al. (1992) demonstrated that canine ventricular myocytes express 3 distinct gap junction proteins, Cx40, Cx43 (GJA1; 121013), and Cx45. Kanter et al. (1994) used PCR with primers based on rat and dog Cx40 to clone human CX40. The CX40 gene has a 5- prime untranslated exon and 1 coding exon, and encodes a predicted 358- amino acid protein whose sequence is 82% identical to that of the rat and mouse CX40 protein. Northern blot analysis showed that CX40 mRNA is expressed as an approximately 3.3- kb transcript in ventricular myocardium. In immunofluorescence studies, CX40 localized to intercalated disc regions of the left ventricle, which join cardiac myocytes and contain gap junc-

tions. The migration of lymphocytes from the circulation into tissues involves a number of adhesion molecules and the expression of new molecules. Gap junctions facilitate cell- to- cell adhesion and provide pathways for direct intercellular communication. Oviedo- Orta et al. (2000) noted that GJA1 is expressed in a number of lymphoid organs. By RT- PCR, Western blot, and flow cytometric analyses, they showed that lymphocytes express GJA1 and GJA5, but not GJB2 (OMIM Ref. No. 121011), GJB1 (OMIM Ref. No. 304040), GJA4 (OMIM Ref. No. 121012), or GJA7; GJA5 expression was restricted to tonsillar T and B lymphocytes. Flow cytometric analysis showed that GJA1 and GJA5 expression increases after mitogenic stimulation. Extracellular connexin mimetic peptide blocked dye transfer between lymphocyte subpopulations, and gap junction inhibitors decreased the production of IgM in cocultured T and B lymphocytes. The results identified gap junction proteins as important cell surface components that modulate immune responses.

[6924]

[6925] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6926] Kanter, H. L.; Saffitz, J. E.; Beyer, E. C. : Cardiac myocytes express multiple gap junction proteins. Circ. Res. 70: 438- 444, 1992. ; and

[6927] Oviedo- Orta, E.; Hoy, T.; Evans, W. H. : Intercellular communication in the immune system: differential expression of connexin40 and 43, and perturbation of gap junction channel function.

[6928] Further studies establishing the function and utilities of GJA5 are found in John Hopkins OMIM database record ID 121013, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein tyrosine phosphatase, non-receptor type substrate 1 (PTPNS1, Accession NM_080792.1) is another GAM52 target gene, herein designated TARGET GENE. PTPNS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTPNS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:15053, to the nucleotide sequence of GAM52 RNA, herein designated GAM RNA, also designated SEQ ID:373.

[6929] Another function of GAM52 is therefore inhibition of Pro-

tein tyrosine phosphatase, non-receptor type substrate 1 (PTPNS1, Accession NM_080792.1) . Accordingly, utilities of GAM52 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1.

[6930]

[6931] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 53 (GAM53), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6932] GAM53 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM53 was detected is described hereinabove with reference to Figs. 8-15.

[6933] GAM53 gene, herein designated GAM GENE, and GAM53 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[6934] GAM53 gene encodes a GAM53 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM53 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM53 precursor RNA is designated SEQ ID:136, and is provided hereinbelow with reference to the sequence listing part.

[6935] GAM53 precursor RNA folds onto itself, forming GAM53 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6936] GAM53 precursor RNA folds onto itself, forming GAM53 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[6937] Nucleotide sequence of GAM53 precursor RNA, designated SEQ-ID: 136, and a schematic representation of a

predicted secondary folding of GAM53 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[6938] An enzyme complex designated DICER COMPLEX, `dices` the GAM53 folded precursor RNA into GAM53 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM53 RNA is designated SEQ ID:359, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[6939] GAM53 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM53 target RNA, herein designated GAM TARGET RNA. GAM53 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6940] GAM53 RNA, herein designated GAM RNA, binds comple-

mentarily to one or more target binding sites located in untranslated regions of GAM53 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM53 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM53 RNA may have a different number of target binding sites in untranslated regions of a GAM53 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6941] The complementary binding of GAM53 RNA, herein designated GAM RNA, to target binding sites on GAM53 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM53 target RNA into GAM53 target pro-

tein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6942] It is appreciated that GAM53 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM53 target genes. The mRNA of each one of this plurality of GAM53 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM53 RNA, herein designated GAM RNA, and which when bound by GAM53 RNA causes inhibition of translation of respective one or more GAM53 target proteins.

[6943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM53 gene, herein designated GAM GENE, on one or more GAM53 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6944] It is appreciated that specific functions and accordingly utilities of GAM53 correlate with, and may be deduced from, the identity of the target genes which GAM53 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6945]

[6946]

[6947] Chromosome 20 open reading frame 39 (C20orf39, Accession NM_024893.1) is a GAM53 target gene, herein designated TARGET GENE. C20orf39 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf39 BINDING SITE, designated SEQ ID:14770, to the nucleotide sequence of GAM53 RNA, herein designated GAM RNA, also designated SEQ ID:359.

[6948] A function of GAM53 is therefore inhibition of Chromosome 20 open reading frame 39 (C20orf39, Accession NM_024893.1) . Accordingly, utilities of GAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf39.

[6949] FLJ10687 (Accession) is another GAM53 target gene, herein designated TARGET GENE. FLJ10687 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10687, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:20126, to the nucleotide sequence of GAM53 RNA, herein designated GAM RNA, also designated SEQ ID:359.

[6950] Another function of GAM53 is therefore inhibition of FLJ10687 (Accession) . Accordingly, utilities of GAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687.

[6951] Fbj murine osteosarcoma viral oncogene homolog b (FOSB, Accession NM_006732.1) is another GAM53 target gene, herein designated TARGET GENE. FOSB BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by FOSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOSB BINDING SITE, designated SEQ ID:7846, to the nucleotide sequence of GAM53 RNA, herein designated GAM RNA, also designated SEQ ID:359.

[6952] Another function of GAM53 is therefore inhibition of Fbj murine osteosarcoma viral oncogene homolog b (FOSB, Accession NM_006732.1), a gene which interacts with jun proteins enhancing their dna binding activity. and therefore may be associated with Cocaine addiction. Accordingly, utilities of GAM53 include diagnosis, prevention and treatment of Cocaine addiction, and of other diseases and clinical conditions associated with FOSB.

[6953] The function of FOSB has been established by previous studies. Cocaine enhances dopamine- mediated neurotransmission by blocking dopamine reuptake at axon terminals. Most dopamine- containing nerve terminals innervate medium spiny neurons in the striatum of the brain. Cocaine addiction is thought to stem, in part, from neural adaptations that act to maintain equilibrium by countering the effects of repeated drug administration.

Chronic exposure to cocaine upregulates several transcription factors that alter gene expression and which could mediate such compensatory neural and behavioral changes. One such transcription factor is delta- FosB, a protein that persists in striatum long after the end of cocaine exposure. Using DNA array analysis of striatal material from inducible transgenic mice, Bibb et al. (2001) identified Cdk5 (OMIM Ref. No. 123831) as a downstream target of delta- FosB. Overexpression of delta- FosB, or chronic cocaine administration, raised levels of Cdk5 mRNA, protein, and activity in the striatum. Moreover, injection of Cdk5 inhibitors into the striatum potentiated behavioral effects of repeated cocaine administration. Bibb et al. (2001) concluded that changes in Cdk5 levels mediated by delta- FosB, and resulting alterations in signaling involving D1 dopamine receptors, contribute to adaptive changes in the brain related to cocaine addiction.

[6954] Animal model experiments lend further support to the function of FOSB. Brown et al. (1996) demonstrated that mice in whom the FOSB gene had been inactivated by homologous recombination displayed a profound defect in reproduction. The reproductive failure of fosB mutant mice was due to a specific behavioral defect that resulted

in an inability to nurture young. This nurturing defect was seen not only in postpartum females but also in young females and males. Together, these findings provided evidence that nurturing behavior in mammals is genetically controlled and that an immediate early gene, FOSB, is critical for an adaptive neuronal response. Brown et al. (1996) speculated that the nurturing defect is likely due to the absence of FOSB in the preoptic area, a region of the hypothalamus that is critical for nurturing. They stated that this is an example of a transcription factor that controls a complex behavior by regulating a specific neuronal circuit.

[6955] It is appreciated that the abovementioned animal model for FOSB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6956] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6957] Bibb, J. A.; Chen, J.; Taylor, J. R.; Svenningsson, P.; Nishi, A.; Snyder, G. L.; Yan, Z.; Sagawa, Z. K.; Ouimet, C. C.; Nairn, A. C.; Nestler, E. J.; Greengard, P. : Effects of chronic exposure to cocaine are regulated by the neuronal protein Cdk5. Nature 410: 376- 380, 2001. ; and

[6958] Brown, J. R.; Ye, H.; Bronson, R. T.; Dikkes, P.; Greenberg, M. E. : A defect in nurturing in mice lacking the immediate early gene fosB. Cell 86: 297- 309, 1996.

[6959] Further studies establishing the function and utilities of FOSB are found in John Hopkins OMIM database record ID 164772, and in cited publications listed in Table 5, which are hereby incorporated by reference.HBP17 (Accession NM_005130.1) is another GAM53 target gene, herein designated TARGET GENE. HBP17 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HBP17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HBP17 BINDING SITE, designated SEQ ID:15114, to the nucleotide sequence of GAM53 RNA, herein designated GAM RNA, also designated SEQ ID:359.

[6960] Another function of GAM53 is therefore inhibition of HBP17 (Accession NM_005130.1) . Accordingly, utilities of GAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBP17.

[6961] Lactate dehydrogenase a (LDHA, Accession NM_005566.1) is another GAM53 target gene, herein designated TARGET GENE. LDHA BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by LDHA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LDHA BINDING SITE, designated SEQ ID:6401, to the nucleotide sequence of GAM53 RNA, herein designated GAM RNA, also designated SEQ ID:359.

[6962] Another function of GAM53 is therefore inhibition of Lactate dehydrogenase a (LDHA, Accession NM_005566.1) . Accordingly, utilities of GAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHA.

[6963] LOC125268 (Accession) is another GAM53 target gene, herein designated TARGET GENE. LOC125268 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC125268, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC125268 BINDING SITE, designated SEQ ID:6730, to the nucleotide sequence of GAM53 RNA, herein designated GAM RNA, also designated SEQ ID:359.

[6964] Another function of GAM53 is therefore inhibition of

LOC125268 (Accession) . Accordingly, utilities of GAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125268.

[6965] Testis-specific transcript, y-linked 11 (TTTY11, Accession NM_031929.1) is another GAM53 target gene, herein designated TARGET GENE. TTTY11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TTTY11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TTTY11 BINDING SITE, designated SEQ ID:10980, to the nucleotide sequence of GAM53 RNA, herein designated GAM RNA, also designated SEQ ID:359.

[6966] Another function of GAM53 is therefore inhibition of Testis-specific transcript, y-linked 11 (TTTY11, Accession NM_031929.1) . Accordingly, utilities of GAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY11.

[6967]

[6968] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 54

(GAM54), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6969] GAM54 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM54 was detected is described hereinabove with reference to Figs. 8-15.

[6970] GAM54 gene, herein designated GAM GENE, and GAM54 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[6971] GAM54 gene encodes a GAM54 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM54 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM54 precursor RNA is designated SEQ ID:167, and is provided hereinbelow with reference to the sequence listing part.

[6972] GAM54 precursor RNA folds onto itself, forming GAM54 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6973] GAM54 precursor RNA folds onto itself, forming GAM54 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[6974] Nucleotide sequence of GAM54 precursor RNA, designated SEQ-ID: 167, and a schematic representation of a predicted secondary folding of GAM54 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[6975] An enzyme complex designated DICER COMPLEX, `dices` the GAM54 folded precursor RNA into GAM54 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA

segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM54 RNA is designated SEQ ID:275, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[6976] GAM54 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM54 target RNA, herein designated GAM TARGET RNA. GAM54 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6977] GAM54 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM54 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM54 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING

SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM54 RNA may have a different number of target binding sites in untranslated regions of a GAM54 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6978] The complementary binding of GAM54 RNA, herein designated GAM RNA, to target binding sites on GAM54 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM54 target RNA into GAM54 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6979] It is appreciated that GAM54 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM54 target genes. The mRNA of each one of this plurality of GAM54 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM54 RNA,

herein designated GAM RNA, and which when bound by GAM54 RNA causes inhibition of translation of respective one or more GAM54 target proteins.

[6980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM54 gene, herein designated GAM GENE, on one or more GAM54 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6981] It is appreciated that specific functions and accordingly utilities of GAM54 correlate with, and may be deduced from, the identity of the target genes which GAM54 binds and inhibits, and the function of these target genes, as

elaborated hereinbelow.

[6982]

[6983]

[6984] A kinase (prka) anchor protein 13 (AKAP13, Accession NM_007200.2) is a GAM54 target gene, herein designated TARGET GENE. AKAP13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:18908, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[6985] A function of GAM54 is therefore inhibition of A kinase (prka) anchor protein 13 (AKAP13, Accession NM_007200.2), a gene which regulates subcellular localization of type II cAMP- dependent PKA. Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13.

[6986] The function of AKAP13 has been established by previous

studies. Gene map locus 15q24- q25 A- kinase anchor proteins (AKAPs; OMIM Ref. No. 602449), such as AKAP13, direct the activity of protein kinase A (PKA; OMIM Ref. No. 176911) by tethering the enzyme near its physiologic substrates. AKAP13 is also known as LBC. Catalytic GDP-GTP exchange factors (GEFs), such as LBC, play an important role in regulating the Rho/Rac GTPase cycle. The Rho/Rac family of small GTPases mediates cytoskeletal reorganization, gene transcription, and cell cycle progression through unique signal transduction pathways. By probing a breast cancer expression library using an interaction cloning strategy for proteins that bind RXR (see OMIM Ref. No. 180245), Rubino et al. (1998) obtained a full- length cDNA encoding LBC, which they called BRX (breast cancer cDNA- encoded nuclear receptor- binding auxiliary protein). The deduced 1,428- amino acid BRX protein contains a region of identity to the LBC sequence identified by Toksoz and Williams (1994) that is preceded by 3 novel regions. A fifth, C- terminal region binds the estrogen receptor (ESR1; 133430). In addition to the tissues detected by Toksoz and Williams (1994), Northern blot analysis by Rubino et al. (1998) revealed BRX mRNA expression in reproductive tissues (ovary and placenta),

and a 5.3- kb BRX transcript was detected in breast cancer cell lines, normal breast, and testis. Western blot and immunohistochemic analysis showed that BRX is expressed as a 170- kD protein in mammary epithelial cell lobules and terminal ducts. Binding analysis determined that BRX binds to ESR1, RXR, PPAR (OMIM Ref. No. 170998), and THR (see OMIM Ref. No. 190120). Regions 4 and 5 of BRX were shown to bind independently to the ligand- binding domain near the C terminus of ESR1 without the requirement of other bridging proteins. Overexpression of BRX in the presence of estrogen augmented the activity of an estrogen response element. ESR activation by BRX could be inhibited by a dominant- negative mutant of CDC42 (OMIM Ref. No. 116952). By genomic sequence and somatic cell hybrid analyses, Sterpetti et al. (1999) determined that proto- LBC and onco- LBC both contain N-terminal DH and PH domains; however, proto- LBC has a distinct C terminus absent in the oncoprotein. FISH with onco- LBC probes localized the LBC gene to 15q24- q25 and showed that onco- LBC represents a chimera derived from fusion with an unrelated sequence on 7q36. Northern blot analysis detected variably sized LBC transcripts and extended the known tissue distribution to spleen and

a number of cancer cell lines. Immunoblot and thin- layer chromatography analysis showed that both proto- and onco- LBC can promote the formation of GTP- bound RHOA (ARHA; 165390). Mutation analysis indicated that the transforming activity of proto- LBC is increased by truncation of the C terminus, and that the DH and PH domains, but not the chromosome 7 sequence, are required for transformation. Immunoblot analysis determined that the proto- LBC form is in the membrane fraction, while the majority of the onco- LBC product is cytosolic, indicating that the C terminus may play a major role in the subcellular localization and regulation of LBC. Using FISH with onco- LBC probes, Sterpetti et al. (1999) localized the LBC gene to 15q24- q25 and showed that onco- LBC represents a chimera derived from fusion with an unrelated sequence on 7q36.

[6987]

[6988] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6989] Rubino, D.; Driggers, P.; Arbit, D.; Kemp, L.; Miller, B.; Coso, O.; Pagliai, K.; Gray, K.; Gutkind, S.; Segars, J. : Characterization of Brx, a novel Dbl family member that

modulates estrogen receptor action. Oncogene 16: 2513-2526, 1998. ; and

[6990] Sterpetti, P.; Hack, A. A.; Bashar, M. P.; Park, B.; Cheng, S.-D.; Knoll, J. H. M.; Urano, T.; Feig, L. A.; Toksoz, D. : Activation of the Lbc Rho exchange factor proto- oncogene by trunc.

[6991] Further studies establishing the function and utilities of AKAP13 are found in John Hopkins OMIM database record ID 604686, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atpase, ca++ transporting, ubiquitous (ATP2A3, Accession NM_174957.1) is another GAM54 target gene, herein designated TARGET GENE. ATP2A3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATP2A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP2A3 BINDING SITE, designated SEQ ID:11692, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[6992] Another function of GAM54 is therefore inhibition of Atpase, ca++ transporting, ubiquitous (ATP2A3, Accession

NM_174957.1) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A3.

[6993] Bn51 (bhk21) temperature sensitivity complementing (BN51T, Accession) is another GAM54 target gene, herein designated TARGET GENE. BN51T BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BN51T, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BN51T BINDING SITE, designated SEQ ID:16770, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[6994] Another function of GAM54 is therefore inhibition of Bn51 (bhk21) temperature sensitivity complementing (BN51T, Accession), a gene which complements a temperature-sensitive cell cycle mutation in BHK cells. Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BN51T.

[6995] The function of BN51T has been established by previous studies. Two temperature- sensitive mutants have been isolated from the BHK- 21 Syrian hamster cell line. Both of

the human genes that complement these mutations, designated ts11 and tsBN51, lead to a block in progression through the G1 phase of the cell cycle at nonpermissive temperatures. Ts11 has been identified as asparagine synthetase; see 108370. The tsBN51 gene encodes a highly charged novel protein of 395 amino acids (Ittmann et al., 1987) whose biochemical function had not yet been determined when Greco et al. (1989) assigned the gene to 8q21 by study of rodent- human hybrid cells and by in situ hybridization using a tsBN51 probe. This is one of a considerable number of temperature- sensitive mutants which have been mapped to various autosomes and in several instances to the X chromosome.

[6996]

[6997] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6998] Ittmann, M.; Greco, A.; Basilico, C. : Isolation of the human gene that complements a temperature- sensitive cell cycle mutation in BHK cells. Molec. Cell. Biol. 7: 3386- 3393, 1987. ; and

[6999] Greco, A.; Ittmann, M.; Barletta, C.; Basilico, C.; Croce, C. M.; Cannizzaro, L. A.; Huebner, K. : Chromosomal local-

ization of human genes required for G(1) progression in mammalian cell.

[7000] Further studies establishing the function and utilities of BN51T are found in John Hopkins OMIM database record ID 187280, and in cited publications listed in Table 5, which are hereby incorporated by reference.DKFZP727G051 (Accession XM_045308.6) is another GAM54 target gene, herein designated TARGET GENE. DKFZP727G051 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP727G051, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP727G051 BINDING SITE, designated SEQ ID:15727, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7001] Another function of GAM54 is therefore inhibition of DKFZP727G051 (Accession XM_045308.6) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727G051.

[7002] Fc fragment of igg, receptor, transporter, alpha (FCGRT,

Accession NM_004107.1) is another GAM54 target gene, herein designated TARGET GENE. FCGRT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FCGRT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCGRT BINDING SITE, designated SEQ ID:3505, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7003] Another function of GAM54 is therefore inhibition of Fc fragment of igg, receptor, transporter, alpha (FCGRT, Accession NM_004107.1), a gene which binds to the fc region of monomeric immunoglobulins gamma. Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCGRT.

[7004] The function of FCGRT has been established by previous studies. The intestinal epithelium of neonatal mice and rats expresses an Fc receptor (FcRn) that mediates the selective uptake of immunoglobulin G (IgG) in mothers' milk, thereby helping newborn animals to acquire passive immunity. Kandil et al. (1996) noted that the IgG in the milk

is bound to FcRn at the apical surface of the intestinal epithelium, and the resultant FcRn- IgG complexes are transcytosed across the epithelium. At the basolateral surface of intestinal epithelial cells, IgG is released from FcRn into blood or tissue fluids. FcRn is structurally similar to the major histocompatibility complex class I molecule, which presents antigenic peptides to T cells. Like the MHC class I molecule, FcRn is made up of a heavy chain (approximately 48 kD) and beta- 2- microglobulin (109700; approximately 12 kD). Its heavy chain shows approximately 35% amino acid sequence identity to that of a typical MHC class I molecule. Furthermore, the genomic organizations of the MHC class I and mouse FcRn heavy chain genes are similar in that the signal peptide, the 3 extracellular domains, the transmembrane region, and the cytoplasmic region are all encoded by separate exons. Story et al. (1994) cloned a cDNA encoding the human gene and symbolized it FcRn. Kandil et al. (1996) isolated human genomic clones for the gene (symbolized FCGRT by them) using 2 murine Fcgrt probes. The exonic sequences of the genomic clones are identical to the cDNA sequence described by Story et al. (1994).

[7005]

[7006] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7007] Kandil, E.; Egashira, M.; Miyosi, O.; Niikawa, N.; Ishibashi, T.; Kasahara, M. : The human gene encoding the heavy chain of the major histocompatibility complex class I- like Fc receptor (FCGRT) maps to 19q13.3. Cytogenet. Cell Genet. 73: 97- 98, 1996. ; and

[7008] Story, C. M.; Mikulska, J. E.; Simister, N. E. : A major histocompatibility complex class I- like Fc receptor cloned from human placenta: possible role in transfer of immunoglobulin G f.

[7009] Further studies establishing the function and utilities of FCGRT are found in John Hopkins OMIM database record ID 601437, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ20422 (Accession NM_017814.1) is another GAM54 target gene, herein designated TARGET GENE. FLJ20422 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20422, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20422

BINDING SITE, designated SEQ ID:6197, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7010] Another function of GAM54 is therefore inhibition of FLJ20422 (Accession NM_017814.1) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20422.

[7011] KIAA0450 (Accession NM_014638.1) is another GAM54 target gene, herein designated TARGET GENE. KIAA0450 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:1094, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7012] Another function of GAM54 is therefore inhibition of KIAA0450 (Accession NM_014638.1) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450.

[7013] LOC145231 (Accession XM_096740.1) is another GAM54

target gene, herein designated TARGET GENE. LOC145231 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145231, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:19216, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7014] Another function of GAM54 is therefore inhibition of LOC145231 (Accession XM_096740.1) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231.

[7015] LOC150005 (Accession XM_097795.1) is another GAM54 target gene, herein designated TARGET GENE. LOC150005 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150005, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150005 BINDING SITE, designated SEQ ID:6667, to the nucleotide sequence of GAM54 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:275.

[7016] Another function of GAM54 is therefore inhibition of LOC150005 (Accession XM_097795.1) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150005.

[7017] LOC152580 (Accession) is another GAM54 target gene, herein designated TARGET GENE. LOC152580 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152580, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152580 BINDING SITE, designated SEQ ID:738, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7018] Another function of GAM54 is therefore inhibition of LOC152580 (Accession) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152580.

[7019] LOC253955 (Accession) is another GAM54 target gene, herein designated TARGET GENE. LOC253955 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC253955, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253955 BINDING SITE, designated SEQ ID:16736, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7020] Another function of GAM54 is therefore inhibition of LOC253955 (Accession) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253955.

[7021] Matrilin 1, cartilage matrix protein (MATN1, Accession NM_002379.2) is another GAM54 target gene, herein designated TARGET GENE. MATN1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MATN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MATN1 BINDING SITE, designated SEQ ID:18773, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7022] Another function of GAM54 is therefore inhibition of Ma-

trilin 1, cartilage matrix protein (MATN1, Accession NM_002379.2), a gene which a major component of the extracellular matrix of nonarticular cartilage. Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATN1.

[7023] The function of MATN1 has been established by previous studies. Cartilage matrix protein is a major component of the extracellular matrix of nonarticular cartilage. Jenkins et al. (1990) used a partial chicken CMP cDNA probe to isolate 3 overlapping human genomic clones. From one of these clones, a probe containing 2 human CMP exons was isolated and used to map the gene to 1p35 by a combination of Southern blot analysis of somatic cell hybrids and in situ chromosomal hybridization. The genomic probe was also used to screen a human retina cDNA library. The protein sequence predicted by the cDNA clones has 496 amino acids, including a 22- residue signal peptide. The structure of the CMP gene (also symbolized CRTM) and polypeptide were strikingly similar in the chicken and in the human. The human gene spans 12 kb and has 8 exons and 7 introns. By linkage studies, Loughlin et al. (1994) demonstrated that the CRTM gene segregated indepen-

dently of several heritable chondrodysplasias: hypochondroplasia, achondroplasia, autosomal dominant SED tarda, and multiple epiphyseal dysplasia. CMP was alternatively named matrilin- 1 by Deak et al. (1997) when they discovered matrilin- 2 (OMIM Ref. No. 602108). Wagener et al. (1997) found that matrilin- 1 is a trimer of identical ellipsoid subunits assembled via their C- terminal extension domains in a coiled- coil alpha- helix. The matrilins, including matrilin- 2 and matrilin- 3 (OMIM Ref. No. 602109), represent a subfamily of extracellular matrix proteins containing the von Willebrand factor type A (vWFA)- like domain. (The vWFA- like domain was first described in von Willebrand factor (OMIM Ref. No. 193400) where it plays a key role in promoting platelet adhesion to the subendothelin. Several vWFA- like domains have been implicated in interactions with collagen.) In some patients with rheumatoid arthritis (RA; 180300) and relapsing polychondritis (RP), an immune response against cartilage collagen II can be detected. However, study of responses against noncollagenous components of cartilage are limited. If an autoimmune response to cartilage proteins is involved in RA and RP, the different patterns of the affected tissues can best be explained if

the respective targets are proteins with specific tissue distributions. Whereas RA preferentially affects diarthrodial joints, RP is characterized by inflammatory attacks on cartilage in different organs, and, preferentially, in the perichondrial layer of cartilage. The inflammatory infiltrates consist of neutrophils, lymphocytes, macrophages, and plasma cells. In early lesions, eosinophils can be observed close to the affected cartilage. A classic appearance of the patient with RP is 'saddle nose,' caused by erosive inflammation of the nasal septum. Another typical symptom is an inflamed external ear (89% of cases), which in some instances leads to ossified ear cartilages (OMIM Ref. No. 165670). Occasionally, joints are affected as a seronegative nonerosive arthritis. The most serious complication of RP is the involvement of the laryngotracheal cartilage, sometimes leading to lethal breathing difficulties. Early signs of airway involvement are cough, dysphonia, and tenderness over the thyroid cartilage. Remarkably, RP is associated with the same HLA haplotype (DR4) as RA, which carries with it approximately the same relative risk (Zeuner et al., 1997; Lang et al., 1993). To investigate whether the tissue distribution of relapsing polychondritis may be explained by a specific immune response, Hans-

son et al. (1999) immunized rats with matrilin- 1, which is expressed predominantly in tracheal cartilage. After 2 to 3 weeks, some rats developed severe inspiratory stridor. They had swollen noses and/or epistaxis, but showed neither joint nor outer ear affection. The inflammatory lesions involved chronic active erosions of cartilage. Female rats were more susceptible than males. The disease susceptibility was controlled by MHC genes, some haplotypes being high responders and others resistant, and by non-MHC genes as well, as indicated by strain differences (the LEW strain was susceptible, and the DA strain resistant). All strains mounted a pronounced IgG response to matrilin- 1. The findings suggested that different cartilage proteins are involved in pathogenic models of RP and RA.

[7024]

[7025] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7026] Jenkins, R. N.; Osborne- Lawrence, S. L.; Sinclair, A. K.; Eddy, R. L., Jr.; Byers, M. G.; Shows, T. B.; Duby, A. D. : Structure and chromosomal location of the human gene encoding cartilage matrix protein. J. Biol. Chem. 265: 19624- 19631, 1990. ; and

[7027] Deak, F.; Piecha, D.; Bachrati, C.; Paulsson, M.; Kiss, I. : Primary structure and expression of matrilin- 2, the closest relative of cartilage matrix protein within the von Willebrand fa.

[7028] Further studies establishing the function and utilities of MATN1 are found in John Hopkins OMIM database record ID 115437, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nadh dehydrogenase (ubiquinone) flavoprotein 3, 10kda (NDUFV3, Accession NM_021075.2) is another GAM54 target gene, herein designated TARGET GENE. NDUFV3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NDUFV3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDUFV3 BINDING SITE, designated SEQ ID:18615, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7029] Another function of GAM54 is therefore inhibition of Nadh dehydrogenase (ubiquinone) flavoprotein 3, 10kda (NDUFV3, Accession NM_021075.2), a gene which transports electrons from NADH to ubiquinone. Accordingly,

utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFV3.

[7030] The function of NDUFV3 has been established by previous studies. NADH:ubiquinone oxidoreductase (complex I; EC 1.6.5.3) is an inner mitochondrial membrane- bound multisubunit enzyme complex. Complex I consists of at least 41 subunits of which 7 are encoded by the mitochondrial genome. See MTND1 (OMIM Ref. No. 516000) through MTND6 (OMIM Ref. No. 516006). As one of the complexes of the mitochondrial respiratory chain, complex I functions in the catalysis of the rotenone- sensitive oxidation of NADH and the reduction of ubiquinone. By means of chaotropic agents, complex I can be resolved into 2 hydrophilic fractions, the flavoprotein fraction and the iron-protein fraction, and a hydrophobic fraction. The flavoprotein fraction comprises the 51-, 24-, and 10- kD subunits, all encoded by the nuclear genes NDUFV1 (OMIM Ref. No. 161015), NDUFV2 (OMIM Ref. No. 600532), and NDUFV3, respectively. This fraction plays a catalytic role in the oxidation of NADH as it is associated with flavoprotein and NAD binding. The 51- kD and 24- kD subunits are involved in electron transfer. The function of the 10- kD

protein is unknown. The human gene for the 10- kD flavoprotein subunit was completely cloned and sequenced by de Coo et al. (1997). The NDUFV3 gene was found to contain 3 exons, spanning 20 kb. The open reading frame contains a 34- codon import sequence and a 74- codon mature protein sequence. Its homology to bovine and rat protein sequence was found but not to any other known protein. Northern blot analysis showed that the NDUFV3 gene is ubiquitously expressed. By fluorescence in situ hybridization, de Coo et al. (1997) assigned the NDUFV3 gene to 21q22.3, where it may play a dosage- dependent role in the phenotype of Down syndrome (OMIM Ref. No. 190685). Berry et al. (2000) found that NDUFV3 is located approximately 120 kb telomeric to PDE9A (OMIM Ref. No. 602973).

[7031]

[7032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7033] Berry, A.; Scott, H. S.; Kudoh, J.; Talior, I.; Korostishevsky, M.; Wattenhofer, M.; Guipponi, M.; Barras, C.; Rossier, C.; Shibuya, K.; Wang, J.; Kawasaki, K.; Asakawa, S.; Minoshima, S.; Shimizu, N.; Antonarakis, S.; Bonne- Tamir,

B. : Refined localization of autosomal recessive nonsyndromic deafness DFNB10 locus using 34 novel microsatellite markers, genomic structure, and exclusion of six known genes in the region. Genomics 68: 22- 29, 2000. ; and

[7034] de Coo, R. F. M.; Buddiger, P.; Smeets, H. J. M.; van Oost, B. A. : Molecular cloning and characterization of the human mitochondrial NADH:oxidoreductase 10- kDa gene (NDUFV3). Genomics.

[7035] Further studies establishing the function and utilities of NDUFV3 are found in John Hopkins OMIM database record ID 602184, and in cited publications listed in Table 5, which are hereby incorporated by reference.OS4 (Accession NM_005730.2) is another GAM54 target gene, herein designated TARGET GENE. OS4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OS4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OS4 BINDING SITE, designated SEQ ID:19362, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7036] Another function of GAM54 is therefore inhibition of OS4 (Accession NM_005730.2) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS4.

[7037] Paired box gene 8 (PAX8, Accession NM_013992.1) is another GAM54 target gene, herein designated TARGET GENE. PAX8 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PAX8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX8 BINDING SITE, designated SEQ ID:1852, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7038] Another function of GAM54 is therefore inhibition of Paired box gene 8 (PAX8, Accession NM_013992.1), a gene which maintaines the functional differentiation of thyroid cell type and therefore is associated with Thyroid dysgenesis. Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of Thyroid dysgenesis, and of other diseases and clinical conditions associated with PAX8.

[7039] The function of PAX8 has been established by previous studies. Pasca di Magliano et al. (2000) demonstrated that PAX8 is sufficient to activate expression of endogenous genes encoding thyroglobulin (TG; 188450), thyroperoxidase (TPO; 274500), and sodium/iodide symporter (SLC5A5; 601843), all thyroid- specific genes. The cell system they used provided direct evidence for the ability of PAX8 to activate transcription of thyroid- specific genes at their chromosomal locus and strongly suggested a fundamental role of this transcription factor in the maintenance of functional differentiation in thyroid cells. Moreover, they showed that PAX8 and thyroid transcription factor- 1 (OMIM Ref. No. 600635) cooperate in the activation of the thyroglobulin promoter.

[7040] Animal model experiments lend further support to the function of PAX8. The thyroid gland develops from 2 distinct embryonic lineages: follicular cells, which produce thyroxine and are of endodermal origin, and parafollicular C- cells, which produce calcitonin and are of neural crest origin. Mice lacking thyroid transcription factor- 1 (OMIM Ref. No. 600635) lack both cell types and thus are unable to develop a thyroid gland. By analysis of Pax8 knockout mice (Pax8 - /-), Mansouri et al. (1998) demonstrated

that Pax8 is required for the formation of the follicular cells in the thyroid. They presented evidence that Pax8 is necessary for providing cues for the differentiation of component endoderm primordia into thyroxine- producing follicular cells.

[7041] It is appreciated that the abovementioned animal model for PAX8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7042] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7043] Pasca di Magliano, M.; Di Lauro, R.; Zannini, M. : Pax8 has a key role in thyroid cell differentiation. Proc. Nat. Acad. Sci. 97: 13144- 13149, 2000. ; and

[7044] Mansouri, A.; Chowdhury, K.; Gruss, P. : Follicular cells of the thyroid gland require Pax8 gene function. Nature Genet. 19: 87- 90, 1998.

[7045] Further studies establishing the function and utilities of PAX8 are found in John Hopkins OMIM database record ID 167415, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pdz domain containing 2 (PDZD2, Accession) is another GAM54 target gene,

herein designated TARGET GENE. PDZD2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PDZD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:16711, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7046] Another function of GAM54 is therefore inhibition of Pdz domain containing 2 (PDZD2, Accession) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2.

[7047] PI4KII (Accession NM_018425.2) is another GAM54 target gene, herein designated TARGET GENE. PI4KII BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PI4KII, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PI4KII BINDING SITE, designated SEQ ID:4231, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also

designated SEQ ID:275.

[7048] Another function of GAM54 is therefore inhibition of PI4KII (Accession NM_018425.2) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PI4KII.

[7049] RCD-8 (Accession NM_014329.2) is another GAM54 target gene, herein designated TARGET GENE. RCD-8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RCD-8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RCD-8 BINDING SITE, designated SEQ ID:7302, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7050] Another function of GAM54 is therefore inhibition of RCD-8 (Accession NM_014329.2) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCD-8.

[7051] Regulator of g-protein signalling 11 (RGS11, Accession NM_003834.1) is another GAM54 target gene, herein designated TARGET GENE. RGS11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by RGS11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGS11 BINDING SITE, designated SEQ ID:3919, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7052] Another function of GAM54 is therefore inhibition of Regulator of g-protein signalling 11 (RGS11, Accession NM_003834.1) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS11.

[7053] XAP135 (Accession) is another GAM54 target gene, herein designated TARGET GENE. XAP135 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by XAP135, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XAP135 BINDING SITE, designated SEQ ID:4269, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7054] Another function of GAM54 is therefore inhibition of XAP135 (Accession) . Accordingly, utilities of GAM54 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with XAP135.

[7055] Zinc finger, dhhc domain containing 3 (ZDHHC3, Accession NM_016598.1) is another GAM54 target gene, herein designated TARGET GENE. ZDHHC3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZDHHC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:16992, to the nucleotide sequence of GAM54 RNA, herein designated GAM RNA, also designated SEQ ID:275.

[7056] Another function of GAM54 is therefore inhibition of Zinc finger, dhhc domain containing 3 (ZDHHC3, Accession NM_016598.1) . Accordingly, utilities of GAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC3.

[7057]

[7058] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 55 (GAM55), which modulates expression of respective target

genes thereof, the function and utility of which target genes is known in the art.

[7059] GAM55 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM55 was detected is described hereinabove with reference to Figs. 8-15.

[7060] GAM55 gene, herein designated GAM GENE, and GAM55 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7061] GAM55 gene encodes a GAM55 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM55 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM55 precursor RNA is designated SEQ ID:5, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5 is located at position 69071145 relative to chromosome 16.

[7062] GAM55 precursor RNA folds onto itself, forming GAM55 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7063] GAM55 precursor RNA folds onto itself, forming GAM55 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7064] Nucleotide sequence of GAM55 precursor RNA, designated SEQ-ID: 5, and a schematic representation of a predicted secondary folding of GAM55 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7065] An enzyme complex designated DICER COMPLEX, `dices` the GAM55 folded precursor RNA into GAM55 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA

segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM55 RNA is designated SEQ ID:387, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7066] GAM55 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM55 target RNA, herein designated GAM TARGET RNA. GAM55 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7067] GAM55 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM55 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM55 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING

SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM55 RNA may have a different number of target binding sites in untranslated regions of a GAM55 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7068] The complementary binding of GAM55 RNA, herein designated GAM RNA, to target binding sites on GAM55 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM55 target RNA into GAM55 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7069] It is appreciated that GAM55 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM55 target genes. The mRNA of each one of this plurality of GAM55 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM55 RNA,

herein designated GAM RNA, and which when bound by GAM55 RNA causes inhibition of translation of respective one or more GAM55 target proteins.

[7070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM55 gene, herein designated GAM GENE, on one or more GAM55 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7071] It is appreciated that specific functions and accordingly utilities of GAM55 correlate with, and may be deduced from, the identity of the target genes which GAM55 binds and inhibits, and the function of these target genes, as

elaborated hereinbelow.

[7072]

[7073]

[7074] Actin binding lim protein 1 (ABLIM1, Accession NP_006710.2) is a GAM55 target gene, herein designated TARGET GENE. ABLIM1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABLIM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABLIM1 BINDING SITE, designated SEQ ID:18812, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7075] A function of GAM55 is therefore inhibition of Actin binding lim protein 1 (ABLIM1, Accession NP_006710.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM1.

[7076] Actin binding lim protein 1 (ABLIM1, Accession NP_002304.2) is another GAM55 target gene, herein designated TARGET GENE. ABLIM1 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABLIM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABLIM1 BINDING SITE, designated SEQ ID:18812, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7077] Another function of GAM55 is therefore inhibition of Actin binding lim protein 1 (ABLIM1, Accession NP_002304.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM1.

[7078] Actin binding lim protein 1 (ABLIM1, Accession NP_006711.2) is another GAM55 target gene, herein designated TARGET GENE. ABLIM1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABLIM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABLIM1 BINDING SITE, designated SEQ ID:18812, to the nucleotide sequence of GAM55 RNA, herein designated

GAM RNA, also designated SEQ ID:387.

[7079] Another function of GAM55 is therefore inhibition of Actin binding lim protein 1 (ABLIM1, Accession NP_006711.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM1.

[7080] Activin a receptor, type ii (ACVR2, Accession NP_001607.1) is another GAM55 target gene, herein designated TARGET GENE. ACVR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACVR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACVR2 BINDING SITE, designated SEQ ID:11850, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7081] Another function of GAM55 is therefore inhibition of Activin a receptor, type ii (ACVR2, Accession NP_001607.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR2.

[7082] Adaptor-related protein complex 2, beta 1 subunit (AP2B1, Accession NP_001273.1) is another GAM55 target

gene, herein designated TARGET GENE. AP2B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AP2B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:7416, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7083] Another function of GAM55 is therefore inhibition of Adaptor-related protein complex 2, beta 1 subunit (AP2B1, Accession NP_001273.1), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1.

[7084] The function of AP2B1 has been established by previous studies. The beta adaptin subunit of the clathrin coat assembly complex, also referred to as AP2- beta, was cloned from human, rat and bovine cDNA libraries by Ponnambalam et al. (1990) who found that the predicted 937- amino acid proteins are totally conserved between species. The protein is part of the AP2 coat assembly pro-

tein complex (see OMIM Ref. No. 601024) and links clathrin (OMIM Ref. No. 118960) to receptors in the coated vesicles. Druck et al. (1995) used a probe from the 3- prime UTR of the human cDNA to map the gene to chromosome 17. Hybrids with portions of chromosome 17 were then used to localize CLAPB1 to 17q11.2- q12.

[7085]

[7086] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7087] Druck, T.; Gu, Y.; Prabhala. G.; Cannizzaro, L. A.; Park, S.-H.; Huebner, K.; Keen, J. H. : Chromosome localization of human genes for clathrin adaptor polypeptides AP2- beta and AP50 and the clathrin- binding protein, VCP. Genomics 30: 94- 97, 1995. ; and

[7088] Ponnambalam, S.; Robinson, M. S.; Jackson, A. P.; Peiperl, L.; Parham, P. : Conservation and diversity in families of coated vesicle adaptins. J. Biol. Chem. 265: 4814- 4820, 1990.

[7089] Further studies establishing the function and utilities of AP2B1 are found in John Hopkins OMIM database record ID 601025, and in cited publications listed in Table 5, which are hereby incorporated by reference.APOARGC

(Accession NP_663779.1) is another GAM55 target gene, herein designated TARGET GENE. APOARGC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOARGC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOARGC BINDING SITE, designated SEQ ID:6057, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7090] Another function of GAM55 is therefore inhibition of APOARGC (Accession NP_663779.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOARGC.

[7091] APOARGC (Accession NP_077818.1) is another GAM55 target gene, herein designated TARGET GENE. APOARGC BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOARGC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOARGC BINDING SITE, designated SEQ ID:6057, to the nucleotide sequence of GAM55 RNA,

herein designated GAM RNA, also designated SEQ ID:387.

[7092] Another function of GAM55 is therefore inhibition of APOARGC (Accession NP_077818.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOARGC.

[7093] Breast carcinoma amplified sequence 1 (BCAS1, Accession NP_003648.1) is another GAM55 target gene, herein designated TARGET GENE. BCAS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BCAS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCAS1 BINDING SITE, designated SEQ ID:6939, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7094] Another function of GAM55 is therefore inhibition of Breast carcinoma amplified sequence 1 (BCAS1, Accession NP_003648.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAS1.

[7095] BOP (Accession XP_097915.2) is another GAM55 target gene, herein designated TARGET GENE. BOP BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by BOP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:18720, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7096] Another function of GAM55 is therefore inhibition of BOP (Accession XP_097915.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP.

[7097] Bromodomain containing 2 (BRD2, Accession NP_005095.1) is another GAM55 target gene, herein designated TARGET GENE. BRD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRD2 BINDING SITE, designated SEQ ID:3080, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7098] Another function of GAM55 is therefore inhibition of Bromodomain containing 2 (BRD2, Accession NP_005095.1) .

Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD2.

[7099] Chromosome 1 open reading frame 21 (C1orf21, Accession NP_110433.1) is another GAM55 target gene, herein designated TARGET GENE. C1orf21 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf21 BINDING SITE, designated SEQ ID:3784, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7100] Another function of GAM55 is therefore inhibition of Chromosome 1 open reading frame 21 (C1orf21, Accession NP_110433.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf21.

[7101] Chromosome 21 open reading frame 45 (C21orf45, Accession NP_061817.1) is another GAM55 target gene, herein designated TARGET GENE. C21orf45 BINDING SITE is a target binding site found in the 5` untranslated re-

gion of mRNA encoded by C21orf45, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf45 BINDING SITE, designated SEQ ID:3897, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7102] Another function of GAM55 is therefore inhibition of Chromosome 21 open reading frame 45 (C21orf45, Accession NP_061817.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf45.

[7103] C6orf149 (Accession NP_065141.2) is another GAM55 target gene, herein designated TARGET GENE. C6orf149 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C6orf149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf149 BINDING SITE, designated SEQ ID:15036, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7104] Another function of GAM55 is therefore inhibition of

C6orf149 (Accession NP_065141.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf149.

[7105] Caveolin 2 (CAV2, Accession NP_001224.1) is another GAM55 target gene, herein designated TARGET GENE. CAV2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAV2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAV2 BINDING SITE, designated SEQ ID:3984, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7106] Another function of GAM55 is therefore inhibition of Caveolin 2 (CAV2, Accession NP_001224.1), a gene which may function as an accessory protein in conjunction with caveolin- 1and act as a scaffolding protein within caveolar membranes. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAV2.

[7107] The function of CAV2 has been established by previous studies. Scherer et al. (1996) identified a protein related to caveolin- 1 (CAV1; 601047) through microsequencing of

adipocyte- derived caveolin- enriched membranes. They called the novel protein caveolin- 2. They stated that caveolins- 1 and - 2 are similar in most respects. For both caveolin- 1 and caveolin- 2, mRNAs are most abundantly expressed in white adipose tissue and are induced during adipocyte differentiation. Caveolin- 2 localizes with caveolin- 1, indicating that caveolin- 2 also localizes to caveolae. However, caveolin- 1 and caveolin- 2 differ in their functional interactions with heterotrimeric G proteins, possibly explaining why caveolins 1 and 2 are coexpressed within a single cell. Specifically, Scherer et al. (1996) found that whereas residues 82 to 101 of murine caveolin- 1 functionally suppressed the basal GTPase activity of purified heterotrimeric G proteins, the corresponding region of caveolin- 2 (which is 30% identical) had a stimulatory effect. Engelman et al. (1998) reviewed the molecular genetics of the caveolin gene family. They compared the genomic organization of the CAV1, CAV2, and CAV3 (OMIM Ref. No. 601253) genes. The CAV1 gene contains 3 exons, while the human CAV2 gene contains 2 exons. The boundary of the last exon of CAV1 and CAV2 are analogous, suggesting that they arose through gene duplication. The genes encoding murine caveolin- 1 and -

2 are colocalized within the A2 region of mouse chromosome 6 (Engelman et al., 1998). By FISH, Engelman et al. (1998) mapped CAV1 and CAV2 to 7q31.1- q31.2. (CA)n microsatellite repeat marker analysis of the CAV genomic clones indicated that they contain the marker D7S522, located at 7q31.1. Thus, the 2 genes map to 7q31 in a region of conserved synteny with murine 6- A2 (2,3:Engelman et al., 1998, 1998).

[7108]

[7109] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7110] Engelman, J. A.; Zhang, X. L.; Galbiati, F.; Lisanti, M. P. : Chromosomal localization, genomic organization, and developmental expression of the murine caveolin gene family (Cav- 1, - 2, and - 3): Cav- 1 and Cav- 2 genes map to a known tumor suppressor locus (6- A2/7q31). FEBS Lett. 429: 330- 336, 1998. ; and

[7111] Scherer, P. E.; Okamoto, T.; Chun, M.; Nishimoto, I.; Lodish, H. F.; Lisanti, M. P. : Identification, sequence, and expression of caveolin- 2 defines a caveolin gene family. Proc. Nat. Ac.

[7112] Further studies establishing the function and utilities of

CAV2 are found in John Hopkins OMIM database record ID 601048, and in cited publications listed in Table 5, which are hereby incorporated by reference.Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1) is another GAM55 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:4255, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7113] Another function of GAM55 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[7114] The function of CBFA2T2 has been established by previous studies. To identify potential new genes homologous

to ETO (OMIM Ref. No. 133435), Fracchiolla et al. (1998) screened the EST database using the entire ETO cDNA sequence as a probe. Among the ESTs identified, they selected 2 overlapping clones and sequenced them to completion. A putative translation initiation site was identified by the presence of a strong Kozak consensus sequence, followed by a 1,725- bp open reading frame coding for a putative protein of 575 amino acids. They named this gene EHT for 'ETO homolog on chromosome twenty.' The putative EHT protein is approximately 65% identical to ETO/MTG8 (OMIM Ref. No. 133435) and approximately 24% identical to an ETO Drosophila homolog, Nervy. Kitabayashi et al. (1998) reported the cloning of a similar cDNA, which they named MTGR1 (myeloid translocation gene- related protein- 1). Their data suggested the presence of 2 alternative 5- prime ends of the MTGR1/EHT gene. Cytogenetic studies had shown that the 20q11 region is deleted in approximately 10% of cases of polycythemia vera, approximately 5% of cases of myelodysplastic syndromes, and approximately 3% of cases of acute myeloid leukemias. Kitabayashi et al. (1998) showed the direct interaction of MTGR1 in the AML1- MTG8 fusion protein, leading to an enhancement of cell proliferation

mediated by granulocyte colony- stimulating factor (CSF3; 138970) in a murine myeloid model. This suggested that MTGR1 has an oncogenic rather than a tumor suppressor activity. Nevertheless, when MTGR1 was transfected alone into the same murine myeloid model cell line, the proliferative response to CSF was lower than that in the normal control, thus suggesting a possible negative growth control in normal cells.

[7115]

[7116] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7117] Fracchiolla, N. S.; Colombo, G.; Finelli, P.; Maiolo, A. T.; Neri, A. : EHT, a new member of the MTG8/ETO gene family, maps on 20q11 region and is deleted in acute myeloid leukemias. (Letter) Blood 92: 3481- 3484, 1998. ; and

[7118] Kitabayashi, I.; Ida, K.; Morohoshi, F.; Yokoyama, A.; Mitsuhashi, N.; Shimizu, K.; Nomura, N.; Hayashi, Y.; Ohki, M. : The AML1- MTG8 leukemic fusion protein forms a complex with a novel.

[7119] Further studies establishing the function and utilities of CBFA2T2 are found in John Hopkins OMIM database record ID 603672, and in cited publications listed in Table

5, which are hereby incorporated by reference.Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1) is another GAM55 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:4255, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7120] Another function of GAM55 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[7121] The function of CBFA2T2 has been established by previous studies. To identify potential new genes homologous to ETO (OMIM Ref. No. 133435), Fracchiolla et al. (1998)

screened the EST database using the entire ETO cDNA sequence as a probe. Among the ESTs identified, they selected 2 overlapping clones and sequenced them to completion. A putative translation initiation site was identified by the presence of a strong Kozak consensus sequence, followed by a 1,725- bp open reading frame coding for a putative protein of 575 amino acids. They named this gene EHT for 'ETO homolog on chromosome twenty.' The putative EHT protein is approximately 65% identical to ETO/MTG8 (OMIM Ref. No. 133435) and approximately 24% identical to an ETO Drosophila homolog, Nervy. Kitabayashi et al. (1998) reported the cloning of a similar cDNA, which they named MTGR1 (myeloid translocation gene- related protein- 1). Their data suggested the presence of 2 alternative 5- prime ends of the MTGR1/EHT gene. Cytogenetic studies had shown that the 20q11 region is deleted in approximately 10% of cases of polycythemia vera, approximately 5% of cases of myelodysplastic syndromes, and approximately 3% of cases of acute myeloid leukemias. Kitabayashi et al. (1998) showed the direct interaction of MTGR1 in the AML1- MTG8 fusion protein, leading to an enhancement of cell proliferation mediated by granulocyte colony- stimulating factor (CSF3;

138970) in a murine myeloid model. This suggested that MTGR1 has an oncogenic rather than a tumor suppressor activity. Nevertheless, when MTGR1 was transfected alone into the same murine myeloid model cell line, the proliferative response to CSF was lower than that in the normal control, thus suggesting a possible negative growth control in normal cells.

[7122]

[7123] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7124] Fracchiolla, N. S.; Colombo, G.; Finelli, P.; Maiolo, A. T.; Neri, A. : EHT, a new member of the MTG8/ETO gene family, maps on 20q11 region and is deleted in acute myeloid leukemias. (Letter) Blood 92: 3481- 3484, 1998. ; and

[7125] Kitabayashi, I.; Ida, K.; Morohoshi, F.; Yokoyama, A.; Mitsuhashi, N.; Shimizu, K.; Nomura, N.; Hayashi, Y.; Ohki, M. : The AML1- MTG8 leukemic fusion protein forms a complex with a novel.

[7126] Further studies establishing the function and utilities of CBFA2T2 are found in John Hopkins OMIM database record ID 603672, and in cited publications listed in Table 5, which are hereby incorporated by reference.CGI-01

(Accession NP_057019.2) is another GAM55 target gene, herein designated TARGET GENE. CGI-01 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CGI-01, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-01 BINDING SITE, designated SEQ ID:19545, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7127] Another function of GAM55 is therefore inhibition of CGI-01 (Accession NP_057019.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-01.

[7128] CPT1C (Accession NP_689572.1) is another GAM55 target gene, herein designated TARGET GENE. CPT1C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CPT1C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPT1C BINDING SITE, designated SEQ ID:13296, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also

designated SEQ ID:387.

[7129] Another function of GAM55 is therefore inhibition of CPT1C (Accession NP_689572.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPT1C.

[7130] Cellular repressor of e1a-stimulated genes (CREG, Accession NP_003842.1) is another GAM55 target gene, herein designated TARGET GENE. CREG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CREG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CREG BINDING SITE, designated SEQ ID:7517, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7131] Another function of GAM55 is therefore inhibition of Cellular repressor of e1a-stimulated genes (CREG, Accession NP_003842.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREG.

[7132] Collapsin response mediator protein 1 (CRMP1, Accession NP_001304.1) is another GAM55 target gene, herein designated TARGET GENE. CRMP1 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by CRMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRMP1 BINDING SITE, designated SEQ ID:16155, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7133] Another function of GAM55 is therefore inhibition of Collapsin response mediator protein 1 (CRMP1, Accession NP_001304.1), a gene which is a member of dihydropyrimidinase family. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRMP1.

[7134] The function of CRMP1 has been established by previous studies. Hamajima et al. (1996) isolated a human cDNA encoding collapsin response mediator protein- 1 (CRMP1), which they called dihydropyrimidinase- related protein- 1 (DRP1), from a fetal brain cDNA library (see OMIM Ref. No. 222748). The deduced CRMP1 protein has 572 amino acids. Northern blot analysis of adult human tissues showed that CRMP1 is abundantly expressed in brain as a major 2.9- kb transcript and a minor 4.9- kb transcript Ruiz- Perez et al. (2000) demonstrated overlap between

the CRMP1 gene and the EVC gene (OMIM Ref. No. 604831), which maps to the same region of 4p and is mutated in the Ellis- van Creveld syndrome (OMIM Ref. No. 225500). The overlap was not confined to the 3- prime UTR but included coding sequence. Because CRMP1 is expressed in developing limb and ectoderm, the autors suggested that this 3- prime complementarity has functional significance

[7135]

[7136] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7137] Hamajima, N.; Matsuda, K.; Sakata, S.; Tamaki, N.; Sasaki, M.; Nonaka, M. : A novel gene family defined by human dihydropyrimidinase and three related proteins with differential tissue distribution. Gene 180: 157- 163, 1996. ; and

[7138] Ruiz- Perez, V. L.; Ide, S. E.; Strom, T. M.; Lorenz, B.; Wilson, D.; Woods, K.; King, L.; Francomano, C.; Freisinger, P.; Spranger, S.; Marino, B.; Dallapiccola, B.; Wright, M.; Meitinge.

[7139] Further studies establishing the function and utilities of CRMP1 are found in John Hopkins OMIM database record

ID 602462, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cullin 3 (CUL3, Accession NP_003581.1) is another GAM55 target gene, herein designated TARGET GENE. CUL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CUL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:7104, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7140] Another function of GAM55 is therefore inhibition of Cullin 3 (CUL3, Accession NP_003581.1), a gene which may target other proteins for ubiquitin- dependent proteolysis. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3.

[7141] The function of CUL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM32.1.Dynactin 4 (p62) (DCTN4, Accession NP_057305.1) is another GAM55 target gene, herein des-

ignated TARGET GENE. DCTN4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCTN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCTN4 BINDING SITE, designated SEQ ID:4858, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7142] Another function of GAM55 is therefore inhibition of Dynactin 4 (p62) (DCTN4, Accession NP_057305.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN4.

[7143] DKFZp761O17121 (Accession NP_115663.1) is another GAM55 target gene, herein designated TARGET GENE. DKFZp761O17121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761O17121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761O17121 BINDING SITE, designated SEQ ID:2906, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated

SEQ ID:387.

[7144] Another function of GAM55 is therefore inhibition of DKFZp761O17121 (Accession NP_115663.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O17121.

[7145] Dynein, cytoplasmic, light polypeptide 2a (DNCL2A, Accession NP_054902.1) is another GAM55 target gene, herein designated TARGET GENE. DNCL2A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DNCL2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNCL2A BINDING SITE, designated SEQ ID:3470, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7146] Another function of GAM55 is therefore inhibition of Dynein, cytoplasmic, light polypeptide 2a (DNCL2A, Accession NP_054902.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNCL2A.

[7147] Dynein, cytoplasmic, light polypeptide 2a (DNCL2A, Ac-

cession NP_808853.1) is another GAM55 target gene, herein designated TARGET GENE. DNCL2A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DNCL2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNCL2A BINDING SITE, designated SEQ ID:3470, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7148] Another function of GAM55 is therefore inhibition of Dynein, cytoplasmic, light polypeptide 2a (DNCL2A, Accession NP_808853.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNCL2A.

[7149] DPF3 (Accession NP_036206.1) is another GAM55 target gene, herein designated TARGET GENE. DPF3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DPF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPF3 BINDING SITE, designated SEQ ID:7186, to the nucleotide sequence

of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7150] Another function of GAM55 is therefore inhibition of DPF3 (Accession NP_036206.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPF3.

[7151] Endothelial differentiation, sphingolipid g-protein-coupled receptor, 3 (EDG3, Accession NP_005217.1) is another GAM55 target gene, herein designated TARGET GENE. EDG3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EDG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG3 BINDING SITE, designated SEQ ID:10947, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7152] Another function of GAM55 is therefore inhibition of Endothelial differentiation, sphingolipid g-protein-coupled receptor, 3 (EDG3, Accession NP_005217.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG3.

[7153] Ephb6 (EPHB6, Accession NP_004436.1) is another GAM55 target gene, herein designated TARGET GENE. EPHB6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EPHB6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPHB6 BINDING SITE, designated SEQ ID:4191, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7154] Another function of GAM55 is therefore inhibition of Ephb6 (EPHB6, Accession NP_004436.1), a gene which Putative Eph- related receptor tyrosine kinase B6. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB6.

[7155] The function of EPHB6 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins. By screening human brain and hematopoietic cell cDNA libraries with the catalytic domain of EPHB4 (OMIM Ref. No. 600011), Matsuoka et al. (1997) cloned a cDNA encoding EPHB6. The predicted 1,006- amino acid EPHB6 protein has the primary structural features of Eph- family receptor tyrosine kinases, but it lacks several invariant residues that have been shown to be essential for tyrosine kinase activity. Expression of the catalytic domain of EPHB6 in mammalian cells resulted in no detectable tyrosine kinase activity in an in vitro assay. Northern blot analysis of normal human adult tissues showed that EPHB6 was expressed as a single 4.0-kb transcript in all tissues examined, with very strong expression in the brain and pancreas. EPHB6 is expressed in normal human brain as a 135- kD protein. By fluores-

cence in situ hybridization, Matsuoka et al. (1997) mapped the EPHB6 gene to 7q33- q35. Neuroblastoma (NB; 256700) is a common pediatric tumor that exhibits a wide range of biologic and clinical heterogeneity. EPH family receptor tyrosine kinases and ligand ephrins play pivotal roles in neural and cardiovascular development. High- level expression of transcripts encoding EPHB6 and its ligands ephrin- B2 (EFNB2; 600527) and ephrin- B3 (EFNB3; 602297) is associated with low- stage NB (stages 1, 2, and 4S) and high expression of TRKA (NTRK1; 191315). Tang et al. (2000) showed that EFNB2 and TRKA expressions were associated with both tumor stage and patient age, whereas EPHB6 and EFNB3 expressions were solely associated with tumor stage, suggesting that these genes were expressed in different subsets of NB. High-level expression of EPHB6, EFNB2, and EFNB3 predicted favorable NB outcome, and their expression combined with TRKA expression predicted the disease outcome more accurately than each variable alone. If any 1 of the 4 genes was expressed at high levels in NB, the patient survival was excellent (more than 90%). Tang et al. (2000) found that transfection of EPHB6 cDNA into neuroblastoma cell lines expressing little endogenous EPHB6 re-

sulted in inhibition of their clonogenicity in culture. Furthermore, transfection of EPHB6 suppressed the tumorigenicity of a cell line in a mouse xenograft model, demonstrating that high- level expressions of favorable NB genes, such as EPHB6, can in fact suppress malignant phenotype of unfavorable NB.

[7156]

[7157] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7158] Matsuoka, H.; Iwata, N.; Ito, M.; Shimoyama, M.; Nagata, A.; Chihara, K.; Takai, S.; Matsui, T. : Expression of a kinase- defective Eph- like receptor in the normal human brain. Biochem. Biophys. Res. Commun. 235: 487- 492, 1997. ; and

[7159] Tang, X. X.; Zhao, H.; Robinson, M. E.; Cohen, B.; Cnaan, A.; London, W.; Cohn, S. L.; Cheung, N.- K. V.; Brodeur, G. M.; Evans, A. E.; Ikegaki, N. : Implications of EPHB6, EFNB2, and EFN.

[7160] Further studies establishing the function and utilities of EPHB6 are found in John Hopkins OMIM database record ID 602757, and in cited publications listed in Table 5, which are hereby incorporated by reference.Epsin 2 (EPN2,

Accession NP_055779.1) is another GAM55 target gene, herein designated TARGET GENE. EPN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EPN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:13330, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7161] Another function of GAM55 is therefore inhibition of Epsin 2 (EPN2, Accession NP_055779.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2.

[7162] Epsin 2 (EPN2, Accession NP_683723.1) is another GAM55 target gene, herein designated TARGET GENE. EPN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EPN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:13330, to the nucleotide sequence of GAM55 RNA,

herein designated GAM RNA, also designated SEQ ID:387.

[7163] Another function of GAM55 is therefore inhibition of Epsin 2 (EPN2, Accession NP_683723.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2.

[7164] F-box only protein 25 (FBXO25, Accession NP_036305.1) is another GAM55 target gene, herein designated TARGET GENE. FBXO25 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FBXO25, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXO25 BINDING SITE, designated SEQ ID:11736, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7165] Another function of GAM55 is therefore inhibition of F-box only protein 25 (FBXO25, Accession NP_036305.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO25.

[7166] FLJ12770 (Accession NP_115550.2) is another GAM55 target gene, herein designated TARGET GENE. FLJ12770 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ12770, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12770 BINDING SITE, designated SEQ ID:14361, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7167] Another function of GAM55 is therefore inhibition of FLJ12770 (Accession NP_115550.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12770.

[7168] FLJ20071 (Accession NP_060123.2) is another GAM55 target gene, herein designated TARGET GENE. FLJ20071 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20071 BINDING SITE, designated SEQ ID:9927, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7169] Another function of GAM55 is therefore inhibition of FLJ20071 (Accession NP_060123.2) . Accordingly, utilities

of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20071.

[7170] FLJ21156 (Accession NP_078878.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ21156 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21156 BINDING SITE, designated SEQ ID:9244, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7171] Another function of GAM55 is therefore inhibition of FLJ21156 (Accession NP_078878.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21156.

[7172] FLJ21736 (Accession NP_079198.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ21736 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21736, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ21736 BINDING SITE, designated SEQ ID:4353, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7173] Another function of GAM55 is therefore inhibition of FLJ21736 (Accession NP_079198.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21736.

[7174] FLJ25461 (Accession NP_659403.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ25461 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25461 BINDING SITE, designated SEQ ID:16876, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7175] Another function of GAM55 is therefore inhibition of FLJ25461 (Accession NP_659403.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25461.

[7176] FLJ32110 (Accession XP_294323.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ32110

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32110, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32110 BINDING SITE, designated SEQ ID:9463, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7177] Another function of GAM55 is therefore inhibition of FLJ32110 (Accession XP_294323.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32110.

[7178] FLJ32934 (Accession NP_653223.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ32934 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32934, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32934 BINDING SITE, designated SEQ ID:16951, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7179] Another function of GAM55 is therefore inhibition of

FLJ32934 (Accession NP_653223.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32934.

[7180] FLJ35976 (Accession NP_775910.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ35976 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35976, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35976 BINDING SITE, designated SEQ ID:16319, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7181] Another function of GAM55 is therefore inhibition of FLJ35976 (Accession NP_775910.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35976.

[7182] FLJ39267 (Accession NP_775821.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ39267 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39267, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ39267 BINDING SITE, designated SEQ ID:14964, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7183] Another function of GAM55 is therefore inhibition of FLJ39267 (Accession NP_775821.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39267.

[7184] FLJ39654 (Accession NP_787110.1) is another GAM55 target gene, herein designated TARGET GENE. FLJ39654 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39654, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39654 BINDING SITE, designated SEQ ID:8343, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7185] Another function of GAM55 is therefore inhibition of FLJ39654 (Accession NP_787110.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39654.

[7186] FLJ40201 (Accession NP_689820.1) is another GAM55 tar-

get gene, herein designated TARGET GENE. FLJ40201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40201 BINDING SITE, designated SEQ ID:3723, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7187] Another function of GAM55 is therefore inhibition of FLJ40201 (Accession NP_689820.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40201.

[7188] Gaba(a) receptor-associated protein like 1 (GABARAPL1, Accession NP_113600.1) is another GAM55 target gene, herein designated TARGET GENE. GABARAPL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GABARAPL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:12594, to the nucleotide sequence of GAM55 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:387.

[7189] Another function of GAM55 is therefore inhibition of Gaba(a) receptor-associated protein like 1 (GABARAPL1, Accession NP_113600.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1.

[7190] GENX-3414 (Accession NP_003934.1) is another GAM55 target gene, herein designated TARGET GENE. GENX-3414 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GENX-3414, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GENX-3414 BINDING SITE, designated SEQ ID:5371, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7191] Another function of GAM55 is therefore inhibition of GENX-3414 (Accession NP_003934.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GENX-3414.

[7192] Histone acetyltransferase 1 (HAT1, Accession NP_003633.1) is another GAM55 target gene, herein des-

ignated TARGET GENE. HAT1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAT1 BINDING SITE, designated SEQ ID:7198, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7193] Another function of GAM55 is therefore inhibition of Histone acetyltransferase 1 (HAT1, Accession NP_003633.1), a gene which acetylates soluble histones H2 and H4 and binds helix 1 of histone H4. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAT1.

[7194] The function of HAT1 has been established by previous studies. The reversible acetylation of specific lysine residues within the N- terminal tails of the core histones is correlated with gene activity. Histone acetylation, particularly of histone H4, has also been proposed to play an important role in replication- dependent nucleosome assembly. The S. cerevisiae Hat1 gene was the first histone acetyltransferase gene to be identified, and its gene product was found to be tightly associated with an accessory

protein. By searching an expressed sequence tag database with the S. cerevisiae Hat1 sequence, Verreault et al. (1998) isolated a cDNA (GenBank AF030424) encoding HAT1, the human ortholog of yeast Hat1. The sequences of the human and yeast HAT1 proteins are 29% identical and 55% similar. The deduced 419- amino acid human HAT1 contains D, A, and B motifs, which are present in many N- acetyltransferases, including those that acetylate substrates other than histones. HAT1 also contains a putative bipartite nuclear localization signal; however, deletion of this signal had no effect on the intranuclear localization of HAT1. The authors purified the HAT1 holoenzyme from human 293 cells and found that it consists of 2 subunits: the catalytic 46- kD HAT1 and the accessory p46 (RBBP7; 602922). The p46 subunit stimulated the activity of HAT1 and bound to core histones. The HAT1 holoenzyme acetylated newly synthesized but not nucleosomal histone H4 at lys5 and lys12, and, to a lesser extent, histone H2A at lys5. Verreault et al. (1998) showed that the HAT1 and p46 polypeptides are located in the nucleus of S- phase cells. In their GenBank submission, these authors indicated that the HAT1 gene maps to 2q31.2- q33.1.

[7195]

[7196] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7197] Dutnall, R. N.; Tafrov, S. T.; Sternglanz, R.; Ramakrishnan, V. : Structure of the histone acetyltransferase Hat1: a paradigm for the GCN5- related N- acetyltransferase superfamily. Cell 94: 427- 438, 1998. ; and

[7198] Verreault, A.; Kaufman, P. D.; Kobayashi, R.; Stillman, B. : Nucleosomal DNA regulates the core- histone- binding subunit of the human Hat1 acetyltransferase. Curr. Biol. 8: 96- 108, 1998.

[7199] Further studies establishing the function and utilities of HAT1 are found in John Hopkins OMIM database record ID 603053, and in cited publications listed in Table 5, which are hereby incorporated by reference.IPT (Accession NP_060116.1) is another GAM55 target gene, herein designated TARGET GENE. IPT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IPT BINDING SITE, designated SEQ

ID:10622, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7200] Another function of GAM55 is therefore inhibition of IPT (Accession NP_060116.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPT.

[7201] Jagged 1 (alagille syndrome) (JAG1, Accession NP_000205.1) is another GAM55 target gene, herein designated TARGET GENE. JAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JAG1 BINDING SITE, designated SEQ ID:10391, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7202] Another function of GAM55 is therefore inhibition of Jagged 1 (alagille syndrome) (JAG1, Accession NP_000205.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG1.

[7203] KIAA0089 (Accession NP_055956.1) is another GAM55 target gene, herein designated TARGET GENE. KIAA0089

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0089, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:16156, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7204] Another function of GAM55 is therefore inhibition of KIAA0089 (Accession NP_055956.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089.

[7205] KIAA0469 (Accession NP_055666.1) is another GAM55 target gene, herein designated TARGET GENE. KIAA0469 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:3457, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7206] Another function of GAM55 is therefore inhibition of KIAA0469 (Accession NP_055666.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469.

[7207] KIAA1045 (Accession XP_048592.1) is another GAM55 target gene, herein designated TARGET GENE. KIAA1045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:1089, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7208] Another function of GAM55 is therefore inhibition of KIAA1045 (Accession XP_048592.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045.

[7209] KIAA1908 (Accession XP_055834.1) is another GAM55 target gene, herein designated TARGET GENE. KIAA1908 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1908, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:15699, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7210] Another function of GAM55 is therefore inhibition of KIAA1908 (Accession XP_055834.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908.

[7211] KIAA1937 (Accession XP_057107.3) is another GAM55 target gene, herein designated TARGET GENE. KIAA1937 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1937, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1937 BINDING SITE, designated SEQ ID:3380, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7212] Another function of GAM55 is therefore inhibition of

KIAA1937 (Accession XP_057107.3) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1937.

[7213] Keratin 6a (KRT6A, Accession NP_005545.1) is another GAM55 target gene, herein designated TARGET GENE. KRT6A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KRT6A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRT6A BINDING SITE, designated SEQ ID:5931, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7214] Another function of GAM55 is therefore inhibition of Keratin 6a (KRT6A, Accession NP_005545.1), a gene which is required forfilament assembly and therefore may be associated with Pachyonychia congenita, jadassohn-lewandowsky type. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of Pachyonychia congenita, jadassohn- lewandowsky type, and of other diseases and clinical conditions associated with KRT6A.

[7215] The function of KRT6A has been established by previous

studies. Tyner et al. (1985) provided information on the structure of a type II keratin gene. A recent duplication in the basic keratin gene family gave rise to 2 copies of the human K6 gene. One of the copies is expressed at very low levels and may be at a still unextinguished step on the way to becoming a traditional pseudogene. Rosenberg et al. (1991) assigned the KRT6A gene to chromosome 12 by use of Southern blot analysis of somatic cell hybrids. By in situ hybridization of metaphase chromosomes, they demonstrated that the KRT6A gene is located in region 12q12- q14. Pachyonychia congenita (PC) is a rare autosomal dominant disorder characterized by multiple ectodermal abnormalities. Patients with type 1 PC, the Jadassohn- Lewandowsky syndrome (OMIM Ref. No. 167200), have onchyogryposis, palmoplantar hyperkeratosis, follicular hyperkeratosis, and oral leukokeratosis. Those with the rare type 2 PC, the Jackson- Lawler syndrome (OMIM Ref. No. 167210) lack oral involvement. Types 1 and 2 were related to mutations in keratin- 16 (KRT16; 148067) and keratin- 17 (KRT17; 148069), respectively. (Both KRT16 and KRT17 are type I keratins encoded by genes on chromosome 17.) Bowden et al. (1995) identified a mutation in a type II keratin, namely KRT6A, which is encoded

by a gene on chromosome 12. The family was Slovenian and suffered from type 1 pachyonychia (OMIM Ref. No. 167200). K6A is the dominant K6 isoform. Takahashi et al. (1995) screened human genomic and skin cDNA libraries with probes derived from the K6B gene (OMIM Ref. No. 148042), and isolated clones containing the full-length gene and cDNA predicted to encode K6a. As many as 6 different human K6 protein isoforms that are highly related at the gene structure, nucleotide sequence, and predicted amino acid sequence levels were identified. Takahashi et al. (1995) proposed an evolutionary model in which the multiplicity of human K6 genes is explained by successive gene duplication events. Again, they demonstrated that K6A is clearly the dominant K6 isoform in skin tissue samples and cultured epithelial cell lines and that the various isoforms are differentially regulated within and between epithelial tissue types. Wong et al. (2000) found that K6- null mice have changes in the oral mucosa resembling those of pachyonychia congenita. They speculated on why the mice lacked obvious alterations in nail morphology, the conspicuous feature in pachyonychia congenita.

[7216]

[7217] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7218] Wong, P.; Colucci- Guyon, E.; Takahashi, K.; Gu, C.; Babinet, C.; Coulombe, P. A. : Introducing a null mutation in the mouse K6- alpha and K6- beta genes reveals their essential structural role in the oral mucosa. J. Cell Biol. 150: 921- 928, 2000. ; and

[7219] Takahashi, K.; Paladini, R. D.; Coulombe, P. A. : Cloning and characterization of multiple human genes and cDNAs encoding highly related type II keratin 6 isoforms. J. Biol. Chem. 270:.

[7220] Further studies establishing the function and utilities of KRT6A are found in John Hopkins OMIM database record ID 148041, and in cited publications listed in Table 5, which are hereby incorporated by reference.KRT6E (Accession NP_775109.1) is another GAM55 target gene, herein designated TARGET GENE. KRT6E BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KRT6E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRT6E BINDING SITE,

designated SEQ ID:16583, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7221] Another function of GAM55 is therefore inhibition of KRT6E (Accession NP_775109.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRT6E.

[7222] LOC120935 (Accession XP_058518.3) is another GAM55 target gene, herein designated TARGET GENE. LOC120935 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC120935, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC120935 BINDING SITE, designated SEQ ID:8330, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7223] Another function of GAM55 is therefore inhibition of LOC120935 (Accession XP_058518.3) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120935.

[7224] LOC131873 (Accession XP_067585.6) is another GAM55

target gene, herein designated TARGET GENE. LOC131873 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC131873, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:2874, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7225] Another function of GAM55 is therefore inhibition of LOC131873 (Accession XP_067585.6) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873.

[7226] LOC139201 (Accession XP_208439.1) is another GAM55 target gene, herein designated TARGET GENE. LOC139201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC139201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC139201 BINDING SITE, designated SEQ ID:716, to the nucleotide sequence of GAM55 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:387.

[7227] Another function of GAM55 is therefore inhibition of LOC139201 (Accession XP_208439.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139201.

[7228] LOC144202 (Accession XP_084770.5) is another GAM55 target gene, herein designated TARGET GENE. LOC144202 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144202, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144202 BINDING SITE, designated SEQ ID:2814, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7229] Another function of GAM55 is therefore inhibition of LOC144202 (Accession XP_084770.5) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144202.

[7230] LOC144486 (Accession XP_096608.1) is another GAM55 target gene, herein designated TARGET GENE. LOC144486

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144486 BINDING SITE, designated SEQ ID:11985, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7231] Another function of GAM55 is therefore inhibition of LOC144486 (Accession XP_096608.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144486.

[7232] LOC146429 (Accession XP_096998.2) is another GAM55 target gene, herein designated TARGET GENE. LOC146429 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146429, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146429 BINDING SITE, designated SEQ ID:6929, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7233] Another function of GAM55 is therefore inhibition of LOC146429 (Accession XP_096998.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146429.

[7234] LOC151451 (Accession XP_087208.1) is another GAM55 target gene, herein designated TARGET GENE. LOC151451 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151451, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151451 BINDING SITE, designated SEQ ID:14420, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7235] Another function of GAM55 is therefore inhibition of LOC151451 (Accession XP_087208.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151451.

[7236] LOC151534 (Accession NP_612491.1) is another GAM55 target gene, herein designated TARGET GENE. LOC151534 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC151534, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151534 BINDING SITE, designated SEQ ID:3403, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7237] Another function of GAM55 is therefore inhibition of LOC151534 (Accession NP_612491.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151534.

[7238] LOC152426 (Accession XP_098225.1) is another GAM55 target gene, herein designated TARGET GENE. LOC152426 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152426, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152426 BINDING SITE, designated SEQ ID:11108, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7239] Another function of GAM55 is therefore inhibition of

LOC152426 (Accession XP_098225.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152426.

[7240] LOC154062 (Accession XP_087842.1) is another GAM55 target gene, herein designated TARGET GENE. LOC154062 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154062, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154062 BINDING SITE, designated SEQ ID:13591, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7241] Another function of GAM55 is therefore inhibition of LOC154062 (Accession XP_087842.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154062.

[7242] LOC200609 (Accession XP_117256.1) is another GAM55 target gene, herein designated TARGET GENE. LOC200609 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200609, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:14431, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7243] Another function of GAM55 is therefore inhibition of LOC200609 (Accession XP_117256.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609.

[7244] LOC204275 (Accession XP_115290.2) is another GAM55 target gene, herein designated TARGET GENE. LOC204275 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC204275, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC204275 BINDING SITE, designated SEQ ID:5396, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7245] Another function of GAM55 is therefore inhibition of LOC204275 (Accession XP_115290.2) . Accordingly, utili-

ties of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204275.

[7246] LOC254263 (Accession XP_170654.1) is another GAM55 target gene, herein designated TARGET GENE. LOC254263 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254263, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254263 BINDING SITE, designated SEQ ID:10172, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7247] Another function of GAM55 is therefore inhibition of LOC254263 (Accession XP_170654.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254263.

[7248] LOC255328 (Accession XP_172920.1) is another GAM55 target gene, herein designated TARGET GENE. LOC255328 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255328, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255328 BINDING SITE, designated SEQ ID:16456, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7249] Another function of GAM55 is therefore inhibition of LOC255328 (Accession XP_172920.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255328.

[7250] LOC282963 (Accession XP_210834.1) is another GAM55 target gene, herein designated TARGET GENE. LOC282963 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282963 BINDING SITE, designated SEQ ID:12044, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7251] Another function of GAM55 is therefore inhibition of LOC282963 (Accession XP_210834.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC282963.

[7252] LOC283140 (Accession XP_210911.1) is another GAM55 target gene, herein designated TARGET GENE. LOC283140 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283140 BINDING SITE, designated SEQ ID:1899, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7253] Another function of GAM55 is therefore inhibition of LOC283140 (Accession XP_210911.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283140.

[7254] LOC284001 (Accession XP_208958.2) is another GAM55 target gene, herein designated TARGET GENE. LOC284001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284001 BINDING SITE, designated SEQ ID:2281, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7255] Another function of GAM55 is therefore inhibition of LOC284001 (Accession XP_208958.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284001.

[7256] LOC284281 (Accession XP_211415.1) is another GAM55 target gene, herein designated TARGET GENE. LOC284281 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284281, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284281 BINDING SITE, designated SEQ ID:7062, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7257] Another function of GAM55 is therefore inhibition of LOC284281 (Accession XP_211415.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284281.

[7258] LOC284891 (Accession XP_211683.1) is another GAM55 target gene, herein designated TARGET GENE. LOC284891 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284891 BINDING SITE, designated SEQ ID:9719, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7259] Another function of GAM55 is therefore inhibition of LOC284891 (Accession XP_211683.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284891.

[7260] LOC284925 (Accession XP_209414.1) is another GAM55 target gene, herein designated TARGET GENE. LOC284925 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284925, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC284925 BINDING SITE, designated SEQ ID:2906, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7261] Another function of GAM55 is therefore inhibition of LOC284925 (Accession XP_209414.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284925.

[7262] LOC284933 (Accession XP_211695.1) is another GAM55 target gene, herein designated TARGET GENE. LOC284933 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284933, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284933 BINDING SITE, designated SEQ ID:2110, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7263] Another function of GAM55 is therefore inhibition of LOC284933 (Accession XP_211695.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284933.

[7264] LOC285174 (Accession XP_211798.1) is another GAM55 target gene, herein designated TARGET GENE. LOC285174 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285174 BINDING SITE, designated SEQ ID:17470, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7265] Another function of GAM55 is therefore inhibition of LOC285174 (Accession XP_211798.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285174.

[7266] LOC285431 (Accession XP_211898.1) is another GAM55 target gene, herein designated TARGET GENE. LOC285431 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285431, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285431 BINDING SITE, designated SEQ ID:6402, to

the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7267] Another function of GAM55 is therefore inhibition of LOC285431 (Accession XP_211898.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285431.

[7268] LOC285602 (Accession XP_209676.1) is another GAM55 target gene, herein designated TARGET GENE. LOC285602 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285602, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285602 BINDING SITE, designated SEQ ID:4959, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7269] Another function of GAM55 is therefore inhibition of LOC285602 (Accession XP_209676.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285602.

[7270] LOC286418 (Accession XP_210471.1) is another GAM55

target gene, herein designated TARGET GENE. LOC286418 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286418, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286418 BINDING SITE, designated SEQ ID:11434, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7271] Another function of GAM55 is therefore inhibition of LOC286418 (Accession XP_210471.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286418.

[7272] LOC286527 (Accession XP_212336.1) is another GAM55 target gene, herein designated TARGET GENE. LOC286527 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286527, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286527 BINDING SITE, designated SEQ ID:8042, to the nucleotide sequence of GAM55 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:387.

[7273] Another function of GAM55 is therefore inhibition of LOC286527 (Accession XP_212336.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286527.

[7274] LOC348109 (Accession XP_302656.1) is another GAM55 target gene, herein designated TARGET GENE. LOC348109 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348109, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348109 BINDING SITE, designated SEQ ID:13521, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7275] Another function of GAM55 is therefore inhibition of LOC348109 (Accession XP_302656.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348109.

[7276] LOC348454 (Accession XP_290909.1) is another GAM55 target gene, herein designated TARGET GENE. LOC348454

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348454, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348454 BINDING SITE, designated SEQ ID:15633, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7277] Another function of GAM55 is therefore inhibition of LOC348454 (Accession XP_290909.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348454.

[7278] LOC348911 (Accession XP_302915.1) is another GAM55 target gene, herein designated TARGET GENE. LOC348911 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348911 BINDING SITE, designated SEQ ID:6953, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7279] Another function of GAM55 is therefore inhibition of LOC348911 (Accession XP_302915.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348911.

[7280] LOC348938 (Accession XP_300883.1) is another GAM55 target gene, herein designated TARGET GENE. LOC348938 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348938, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348938 BINDING SITE, designated SEQ ID:1743, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7281] Another function of GAM55 is therefore inhibition of LOC348938 (Accession XP_300883.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348938.

[7282] LOC349236 (Accession XP_300988.1) is another GAM55 target gene, herein designated TARGET GENE. LOC349236 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC349236, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349236 BINDING SITE, designated SEQ ID:1579, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7283] Another function of GAM55 is therefore inhibition of LOC349236 (Accession XP_300988.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349236.

[7284] LOC349395 (Accession XP_301067.1) is another GAM55 target gene, herein designated TARGET GENE. LOC349395 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349395, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349395 BINDING SITE, designated SEQ ID:5396, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7285] Another function of GAM55 is therefore inhibition of

LOC349395 (Accession XP_301067.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349395.

[7286] LOC90529 (Accession NP_835223.1) is another GAM55 target gene, herein designated TARGET GENE. LOC90529 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90529 BINDING SITE, designated SEQ ID:17696, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7287] Another function of GAM55 is therefore inhibition of LOC90529 (Accession NP_835223.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90529.

[7288] LOC91661 (Accession NP_612381.1) is another GAM55 target gene, herein designated TARGET GENE. LOC91661 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91661, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:19784, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7289] Another function of GAM55 is therefore inhibition of LOC91661 (Accession NP_612381.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661.

[7290] Mitogen-activated protein kinase kinase kinase 8 (MAP3K8, Accession NP_005195.2) is another GAM55 target gene, herein designated TARGET GENE. MAP3K8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAP3K8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K8 BINDING SITE, designated SEQ ID:10457, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7291] Another function of GAM55 is therefore inhibition of Mi-

togen-activated protein kinase kinase kinase 8 (MAP3K8, Accession NP_005195.2), a gene which is able to activate nf- kappa- b 1 by stimulating proteasome- mediated p. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K8.

[7292] The function of MAP3K8 has been established by previous studies. By transfecting the hamster embryonic cell line SHOK with DNA extracted from a human thyroid carcinoma cell line, Miyoshi et al. (1991) identified the transforming oncogene 'cancer Osaka thyroid' (COT). Sequence analysis revealed that COT is a serine- threonine protein kinase. The authors compared genomic clones of COT from transformed SHOK cells and from human placenta cells and found that the COT oncogene had undergone a rearrangement within the last coding exon, an event which probably occurred during the initial transfection experiment. The COT protooncogene contains 8 exons. Aoki et al. (1993) reported that the predicted normal COT protein has 467 amino acids. In the COT oncoprotein, the C- terminal 70 amino acids of normal COT are replaced by 18 novel residues. Cell fractionation and immunoprecipitation studies demonstrated that the COT protooncogene

encodes 58- and 52- kD proteins that are located in the cytosol. Both proteins have serine/threonine kinase activity. The 2 COT isoforms appear to result from the use of alternative translation initiation sites. The 58- kD isoform had stronger transforming activity than the 52- kD protein, although this activity was much weaker than that of the oncoprotein. Aoki et al. (1993) suggested that the N-terminal domain of COT may be necessary for cellular transformation, whereas the C- terminal domain may negatively regulate the transforming activity. Chan et al. (1993) isolated a Ewing sarcoma cell line cDNA that transformed NIH3T3 cells. They designated the gene EST for 'Ewing sarcoma transformant' and identified it as COT. Since the EST cDNA encodes the normal form of the COT protein, the authors concluded that the COT gene can be activated as an oncogene by overexpression as well as by gene rearrangement. Northern blot analysis revealed that COT is expressed as a 3.2- kb mRNA in human fibroblasts and epithelial cells. Treatment of a lung fibroblast cell line with the tumor promoter okadaic acid induced COT expression

[7293]

[7294] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[7295] Aoki, M.; Hamada, F.; Sugimoto, T.; Sumida, S.; Akiyama, T.; Toyoshima, K. : The human cot proto- oncogene encodes two protein serine/threonine kinases with different transforming activities by alternative initiation of translation. J. Biol. Chem. 268: 22723- 22732, 1993. ; and

[7296] Chan, A. M.- L.; Chedid, M.; McGovern, E. S.; Popescu, N. C.; Miki, T.; Aaronson, S. A. : Expression cDNA cloning of a serine kinase transforming gene. Oncogene 8: 1329-1333, 1993.

[7297] Further studies establishing the function and utilities of MAP3K8 are found in John Hopkins OMIM database record ID 603259, and in cited publications listed in Table 5, which are hereby incorporated by reference.MAWBP (Accession NP_071412.1) is another GAM55 target gene, herein designated TARGET GENE. MAWBP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAWBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAWBP BINDING SITE, designated SEQ ID:14451, to the nucleotide se-

quence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7298] Another function of GAM55 is therefore inhibition of MAWBP (Accession NP_071412.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAWBP.

[7299] Methyl-cpg binding domain protein 2 (MBD2, Accession NP_056647.1) is another GAM55 target gene, herein designated TARGET GENE. MBD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MBD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBD2 BINDING SITE, designated SEQ ID:12364, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7300] Another function of GAM55 is therefore inhibition of Methyl-cpg binding domain protein 2 (MBD2, Accession NP_056647.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD2.

[7301] Methyl-cpg binding domain protein 2 (MBD2, Accession

NP_003918.1) is another GAM55 target gene, herein designated TARGET GENE. MBD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MBD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MBD2 BINDING SITE, designated SEQ ID:12364, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7302] Another function of GAM55 is therefore inhibition of Methyl-cpg binding domain protein 2 (MBD2, Accession NP_003918.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD2.

[7303] Mutated in colorectal cancers (MCC, Accession NP_002378.1) is another GAM55 target gene, herein designated TARGET GENE. MCC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCC BINDING SITE, designated

SEQ ID:2297, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7304] Another function of GAM55 is therefore inhibition of Mutated in colorectal cancers (MCC, Accession NP_002378.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCC.

[7305] Mitochondrial capsule selenoprotein (MCSP, Accession NP_109588.2) is another GAM55 target gene, herein designated TARGET GENE. MCSP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCSP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCSP BINDING SITE, designated SEQ ID:11169, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7306] Another function of GAM55 is therefore inhibition of Mitochondrial capsule selenoprotein (MCSP, Accession NP_109588.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCSP.

[7307] Mannosyl (alpha-1,3-)-glycoprotein beta-

1,4-n-acetylglucosaminyltransferase, isoenzyme b (MGAT4B, Accession NP_463459.1) is another GAM55 target gene, herein designated TARGET GENE. MGAT4B BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MGAT4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGAT4B BINDING SITE, designated SEQ ID:15568, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7308] Another function of GAM55 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein beta-1,4-n-acetylglucosaminyltransferase, isoenzyme b (MGAT4B, Accession NP_463459.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT4B.

[7309] MGC14386 (Accession NP_291022.1) is another GAM55 target gene, herein designated TARGET GENE. MGC14386 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC14386, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC14386 BINDING SITE, designated SEQ ID:18289, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7310] Another function of GAM55 is therefore inhibition of MGC14386 (Accession NP_291022.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14386.

[7311] MGC23166 (Accession NP_689948.1) is another GAM55 target gene, herein designated TARGET GENE. MGC23166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC23166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC23166 BINDING SITE, designated SEQ ID:19091, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7312] Another function of GAM55 is therefore inhibition of MGC23166 (Accession NP_689948.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC23166.

[7313] NaGLT1 (Accession NP_699200.1) is another GAM55 target gene, herein designated TARGET GENE. NaGLT1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NaGLT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NaGLT1 BINDING SITE, designated SEQ ID:14714, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7314] Another function of GAM55 is therefore inhibition of NaGLT1 (Accession NP_699200.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NaGLT1.

[7315] N-acetyltransferase 8 (camello like) (NAT8, Accession NP_003951.2) is another GAM55 target gene, herein designated TARGET GENE. NAT8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NAT8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAT8 BINDING SITE, designated

SEQ ID:12162, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7316] Another function of GAM55 is therefore inhibition of N-acetyltransferase 8 (camello like) (NAT8, Accession NP_003951.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAT8.

[7317] Nk2 transcription factor related, locus 8 (drosophila) (NKX2-8, Accession NP_055175.2) is another GAM55 target gene, herein designated TARGET GENE. NKX2-8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NKX2-8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NKX2-8 BINDING SITE, designated SEQ ID:10500, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7318] Another function of GAM55 is therefore inhibition of Nk2 transcription factor related, locus 8 (drosophila) (NKX2-8, Accession NP_055175.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX2-8.

[7319] Nucleophosmin (nucleolar phosphoprotein b23, numatrin) (NPM1, Accession NP_002511.1) is another GAM55 target gene, herein designated TARGET GENE. NPM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPM1 BINDING SITE, designated SEQ ID:5396, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7320] Another function of GAM55 is therefore inhibition of Nucleophosmin (nucleolar phosphoprotein b23, numatrin) (NPM1, Accession NP_002511.1), a gene which is associated with nucleolar ribonucleoprotein structures and binds single- stranded nucleic acids. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPM1.

[7321] The function of NPM1 has been established by previous studies. Nucleophosmin is a nucleolar phosphoprotein that is more abundant in tumor cells than in normal resting cells. Stimulation of the growth of normal cells, e.g., mitogen activation of B lymphocytes, is accompanied by

an increase in nucleophosmin protein level. Although the function of nucleophosmin has not been defined precisely, ample evidence suggests that it is involved in the assembly of ribosomal proteins into ribosomes. Electron microscopic study indicates that nucleophosmin is concentrated in the granular region of the nucleolus, where ribosome assembly occurs. Chan et al. (1989) reported the nucleotide sequence of a cDNA of human nucleophosmin. The cDNA has a coding sequence equivalent to a protein of 294 amino acids. When protein levels were compared with Western blot immunoassays, Novikoff hepatoma showed 20 times more nucleophosmin than normal, and hypertrophic rat liver showed about 5 times more nucleophosmin than unstimulated normal liver.

[7322] Animal model experiments lend further support to the function of NPM1. Cheng et al. (1999) generated transgenic mice with Plzf- Rara and Npm- Rara. Plzf- Rara transgenic animals developed chronic myeloid leukemia-like phenotypes at an early stage in life (within 3 months in 5 of 6 mice), whereas 3 Npm- Rara transgenic mice showed a spectrum of phenotypes from typical APL to chronic myeloid leukemia relatively late in life (from 12 to 15 months). In contrast to bone marrow cells from Plzf-

Rara transgenic mice, those from Npm- Rara transgenic mice could be induced to differentiate by all- trans- retinoic acid (ATRA). Cheng et al. (1999) found that in interacting with nuclear coreceptors the 2 fusion proteins had different ligand sensitivities, which may be the underlying molecular mechanism for differential responses to ATRA. These data clearly established the leukemogenic role of PLZF- RARA and NPM- RARA and the importance of fusion receptor/corepressor interactions in the pathogenesis as well as in determining different clinical phenotypes of APL.

[7323] It is appreciated that the abovementioned animal model for NPM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7324] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7325] Chan, W.- Y.; Liu, Q.- R.; Borjigin, J.; Busch, H.; Rennert, O. M.; Tease, L. A.; Chan, P.- K. : Characterization of the cDNA encoding human nucleophosmin and studies of its role in normal and abnormal growth. Biochemistry 28: 1033- 1039, 1989. ; and

[7326] Cheng, G.- X.; Zhu, X.- H.; Men, X.- Q.; Wang, L.; Huang, Q.- H.; Jin, X. L.; Xiong, S.- M.; Zhu, J.; Guo, W.- M.; Chen, J.- Q.; Xu, S.- F.; So, E.; Chan, L.- C.; Waxman, S.; Zelent, A.; Chen, G.

[7327] Further studies establishing the function and utilities of NPM1 are found in John Hopkins OMIM database record ID 164040, and in cited publications listed in Table 5, which are hereby incorporated by reference.PART1 (Accession NP_057674.1) is another GAM55 target gene, herein designated TARGET GENE. PART1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PART1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PART1 BINDING SITE, designated SEQ ID:6436, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7328] Another function of GAM55 is therefore inhibition of PART1 (Accession NP_057674.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PART1.

[7329] Pbx/knotted 1 homeobox 1 (PKNOX1, Accession NP_004562.2) is another GAM55 target gene, herein des-

ignated TARGET GENE. PKNOX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKNOX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKNOX1 BINDING SITE, designated SEQ ID:6249, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7330] Another function of GAM55 is therefore inhibition of Pbx/knotted 1 homeobox 1 (PKNOX1, Accession NP_004562.2), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX1.

[7331] The function of PKNOX1 has been established by previous studies. As part of developing a transcript map of human chromosome 21, Chen et al. (1997) used exon trapping to identify portions of genes from chromosome 21- specific cosmids. They identified a trapped exon that is identical to a region of the human expressed sequence tag (EST) L12425. Using the exon and EST as probes, they screened human fetal brain and kidney cDNA libraries and cloned

the corresponding gene, which encodes a homeodomain-containing polypeptide of 436 amino acids. Chen et al. (1997) used the EST as a probe for Northern analysis and detected transcripts of 2.5 and 5 kb in every human tissue examined, including heart, brain and brain subregions, placenta, lung, liver, muscle, and several fetal tissues. The gene, designated PBX/knotted- 1 homeo box- 1 (OMIM Ref. No. PKNOX1), has a homeodomain closely related to those of the mammalian PBX family (such as mouse Meis1) and the plant knotted- 1 family (involved in plant development). Chen et al. (1997) used PCR amplification, hybridization, and genetic linkage analysis to map PKNOX1 to 21q22.3 between markers D21S212 and D21S25 on YAC350F7. By fluorescence in situ hybridization, Berthelsen et al. (1998) mapped the PKNOX1 gene to human chromosome 21q22.3 and mouse chromosome 17B/C.

[7332]

[7333] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7334] Berthelsen, J.; Viggiano, L.; Schulz, H.; Ferretti, E.; Consalez, G. G.; Rocchi, M.; Blasi, F. : PKNOX1, a gene encod-

ing PREP1, a new regulator of Pbx activity, maps on human chromosome 21q22.3 and murine chromosome 17B/C. Genomics 47: 323- 324, 1998. ; and

[7335] Chen, H.; Rossier, C.; Nakamura, Y.; Lynn, A.; Chakravarti, A.; Antonarakis, S. E. : Cloning of a novel homeobox-containing gene, PKNOX1, and mapping to human chromosome 21q22.3. Genomi.

[7336] Further studies establishing the function and utilities of PKNOX1 are found in John Hopkins OMIM database record ID 602100, and in cited publications listed in Table 5, which are hereby incorporated by reference.Proteasome (prosome, macropain) subunit, alpha type, 1 (PSMA1, Accession NP_683877.1) is another GAM55 target gene, herein designated TARGET GENE. PSMA1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PSMA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSMA1 BINDING SITE, designated SEQ ID:4352, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7337] Another function of GAM55 is therefore inhibition of Pro-

teasome (prosome, macropain) subunit, alpha type, 1 (PSMA1, Accession NP_683877.1), a gene which is responsible for the degradation of most cellular proteins. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMA1.

[7338] The function of PSMA1 has been established by previous studies. DeMartino et al. (1991) cloned the PSMA1 gene, termed 'subunit nu' by them. The cDNA encoded a 263-amino acid polypeptide. The calculated and observed molecular masses are 29.5 kD and 35 kD, respectively. Northern blot analysis revealed an 1.4- kb mRNA in human placenta and HeLa cells. Coux et al. (1996) noted that 2 proteins, HC2 (29.5 kD) and Pros30 (30.2 kD), are encoded by the PSMA1 gene. Coux et al. (1996) reviewed the structures and functions of the 20S proteasome subunits. The alpha subunits comprise the outer rings of the proteasome. Some alpha subunits contain a functional nuclear localization signal; proteasomes are found in both the nuclear and cytoplasmic compartments of the cell. Alpha subunits may constitute a physical barrier that limits access of cytosolic proteins into the inner proteolytic chamber. Bey et al. (1993) mapped the PSMA1 gene to

chromosome 11p15.1 by fluorescence in situ hybridization

[7339]

[7340] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7341] Bey, F.; Silva Pereira, I.; Coux, O.; Viegas- Pequignot, E.; Recillas Targa, F.; Nothwang, H. G.; Dutrillaux, B.; Scherer, K. : The prosomal RNA- binding protein p27K is a member of the alpha- type human prosomal gene family. Molec. Gen. Genet. 237: 193- 205, 1993. ; and

[7342] Coux, O.; Tanaka, K.; Goldberg, A. L. : Structure and functions of the 20S and 26S proteasomes. Ann. Rev. Biochem. 65: 801- 847, 1996.

[7343] Further studies establishing the function and utilities of PSMA1 are found in John Hopkins OMIM database record ID 602854, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphotriesterase related (PTER, Accession NP_109589.2) is another GAM55 target gene, herein designated TARGET GENE. PTER BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTER, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTER BINDING SITE, designated SEQ ID:8150, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7344] Another function of GAM55 is therefore inhibition of Phosphotriesterase related (PTER, Accession NP_109589.2), a gene which is a phosphotriesterase homology protein. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTER.

[7345] The function of PTER has been established by previous studies. Microbial phosphotriesterases are a group of zinc metalloenzymes that catalyze the hydrolysis of a range of phosphotriester compounds. Davies et al. (1997) isolated rat cDNAs encoding a phosphotriesterase homolog, which they named rpr1. Using a rat rpr1 cDNA as a hybridization probe, Alimova- Kost et al. (1998) isolated human genomic sequences of PTER, a homolog of phosphotriesterases. By FISH, Alimova- Kost et al. (1998) mapped the human PTER gene to 10p12

[7346]

[7347] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[7348] Alimova- Kost, M. V.; Imreh, S.; Buchman, V. L.; Ninkina, N. N. : Assignment of phosphotriesterase- related gene (PTER) to human chromosome band 10p12 by in situ hybridization. Cytogenet. Cell Genet. 83: 16- 17, 1998. ; and

[7350] Further studies establishing the function and utilities of PTER are found in John Hopkins OMIM database record ID 604446, and in cited publications listed in Table 5, which are hereby incorporated by reference.Retinoic acid induced 15 (RAI15, Accession XP_039548.2) is another GAM55 target gene, herein designated TARGET GENE. RAI15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAI15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAI15 BINDING SITE, designated SEQ ID:9537, to the nu-

cleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7351] Another function of GAM55 is therefore inhibition of Retinoic acid induced 15 (RAI15, Accession XP_039548.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI15.

[7352] Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_055552.1) is another GAM55 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:6459, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7353] Another function of GAM55 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_055552.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[7354] Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739579.1) is another GAM55 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:6459, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7355] Another function of GAM55 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739579.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[7356] Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739580.1) is another GAM55 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:6459, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7357] Another function of GAM55 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739580.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[7358] Ribosomal protein l17 (RPL17, Accession NP_000976.1) is another GAM55 target gene, herein designated TARGET GENE. RPL17 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RPL17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPL17 BINDING SITE, designated SEQ ID:14681, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7359] Another function of GAM55 is therefore inhibition of Ribosomal protein l17 (RPL17, Accession NP_000976.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with RPL17.

[7360] SEC22L3 (Accession NP_004197.1) is another GAM55 target gene, herein designated TARGET GENE. SEC22L3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SEC22L3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEC22L3 BINDING SITE, designated SEQ ID:5454, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7361] Another function of GAM55 is therefore inhibition of SEC22L3 (Accession NP_004197.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC22L3.

[7362] Solute carrier family 25 (mitochondrial carrier; dicarboxylate transporter), member 10 (SLC25A10, Accession NP_036272.2) is another GAM55 target gene, herein designated TARGET GENE. SLC25A10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC25A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of SLC25A10 BINDING SITE, designated SEQ ID:15569, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7363] Another function of GAM55 is therefore inhibition of Solute carrier family 25 (mitochondrial carrier; dicarboxylate transporter), member 10 (SLC25A10, Accession NP_036272.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A10.

[7364] SYNE2 (Accession NP_055995.2) is another GAM55 target gene, herein designated TARGET GENE. SYNE2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYNE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYNE2 BINDING SITE, designated SEQ ID:19149, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7365] Another function of GAM55 is therefore inhibition of SYNE2 (Accession NP_055995.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SYNE2.

[7366] TA-PP2C (Accession NP_644812.1) is another GAM55 target gene, herein designated TARGET GENE. TA-PP2C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TA-PP2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TA-PP2C BINDING SITE, designated SEQ ID:2661, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7367] Another function of GAM55 is therefore inhibition of TA-PP2C (Accession NP_644812.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-PP2C.

[7368] Tripartite motif-containing 10 (TRIM10, Accession NP_006769.1) is another GAM55 target gene, herein designated TARGET GENE. TRIM10 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TRIM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

TRIM10 BINDING SITE, designated SEQ ID:7339, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7369] Another function of GAM55 is therefore inhibition of Tripartite motif-containing 10 (TRIM10, Accession NP_006769.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM10.

[7370] Thioredoxin reductase 2 (TXNRD2, Accession NP_665690.1) is another GAM55 target gene, herein designated TARGET GENE. TXNRD2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TXNRD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TXNRD2 BINDING SITE, designated SEQ ID:14503, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7371] Another function of GAM55 is therefore inhibition of Thioredoxin reductase 2 (TXNRD2, Accession NP_665690.1), a gene which is one mitochondrial thioredoxin reductase. Accordingly, utilities of GAM55 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TXNRD2.

[7372] The function of TXNRD2 has been established by previous studies. By screening placenta, heart, and fetal heart cDNA libraries with a fragment of TXNRD1, or TR- alpha, as probe, Gasdaska et al. (1999) isolated a cDNA encoding TR- beta. The deduced 524- amino acid protein, which is 54% identical to TXNRD1, has a high content of positively charged residues in the N terminus and a conserved penultimate sec residue. Analysis of the 3- prime UTR revealed the presence of a region with the sequence and structure of a SECIS, although it is distinct from that of TXNRD1. Northern blot analysis detected ubiquitous expression of a 2.4- kb TR- beta transcript, with highest levels in prostate, testis, liver, uterus, and small intestine; this expression pattern is distinct from that of TXNRD1. Western blot analysis showed expression of a 54- kD cytosolic protein. Functional analysis confirmed the activity of TR- beta as a thioredoxin reductase that can directly reduce proteins such as insulin. By searching an EST database for sequences homologous to TXNRD1, Miranda- Vizuete et al. (1999) obtained a nearly complete cDNA encoding TR- beta, which they called TRXR2. The

predicted protein contains an N- terminal mitochondrial localization sequence (MLS), conserved FAD- and NADPH-binding domains, and a conserved active site. Fluorescence microscopy and mutation analysis demonstrated a mitochondrial localization that requires the presence of the N- terminal MLS.

[7373]

[7374] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7375] Gasdaska, P. Y.; Berggren, M. M.; Berry, M. J.; Powis, G. : Cloning, sequencing, and functional expression of a novel human thioredoxin reductase. FEBS Lett. 442: 105- 111, 1999. ; and

[7376] Miranda- Vizuete, A.; Damdimopoulos, A. E.; Spyrou, G. : cDNA cloning, expression and chromosomal localization of the mouse mitochondrial thioredoxin reductase gene. Biochim. Biophys. Acta 1.

[7377] Further studies establishing the function and utilities of TXNRD2 are found in John Hopkins OMIM database record ID 606448, and in cited publications listed in Table 5, which are hereby incorporated by reference.VEZATIN (Accession NP_060069.2) is another GAM55 target gene,

herein designated TARGET GENE. VEZATIN BINDING SITE1 and VEZATIN BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by VEZATIN, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VEZATIN BINDING SITE1 and VEZATIN BINDING SITE2, designated SEQ ID:18752 and SEQ ID:14500 respectively, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7378] Another function of GAM55 is therefore inhibition of VEZATIN (Accession NP_060069.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN.

[7379] VMP1 (Accession NP_112200.2) is another GAM55 target gene, herein designated TARGET GENE. VMP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by VMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VMP1 BINDING SITE, designated SEQ ID:8550, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also

designated SEQ ID:387.

[7380] Another function of GAM55 is therefore inhibition of VMP1 (Accession NP_112200.2) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VMP1.

[7381] Zinc finger protein 41 (ZNF41, Accession NP_700359.1) is another GAM55 target gene, herein designated TARGET GENE. ZNF41 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF41, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF41 BINDING SITE, designated SEQ ID:10401, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7382] Another function of GAM55 is therefore inhibition of Zinc finger protein 41 (ZNF41, Accession NP_700359.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF41.

[7383] Zinc finger protein 41 (ZNF41, Accession NP_009061.1) is another GAM55 target gene, herein designated TARGET

GENE. ZNF41 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF41, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF41 BINDING SITE, designated SEQ ID:10401, to the nucleotide sequence of GAM55 RNA, herein designated GAM RNA, also designated SEQ ID:387.

[7384] Another function of GAM55 is therefore inhibition of Zinc finger protein 41 (ZNF41, Accession NP_009061.1) . Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF41.

[7385]

[7386] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 56 (GAM56), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7387] GAM56 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method

by which GAM56 was detected is described hereinabove with reference to Figs. 8-15.

[7388] GAM56 gene, herein designated GAM GENE, and GAM56 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7389] GAM56 gene encodes a GAM56 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM56 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM56 precursor RNA is designated SEQ ID:23, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:23 is located at position 167913324 relative to chromosome 5.

[7390] GAM56 precursor RNA folds onto itself, forming GAM56 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7391] GAM56 precursor RNA folds onto itself, forming GAM56 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7392] Nucleotide sequence of GAM56 precursor RNA, designated SEQ-ID: 23, and a schematic representation of a predicted secondary folding of GAM56 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7393] An enzyme complex designated DICER COMPLEX, `dices` the GAM56 folded precursor RNA into GAM56 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM56 RNA is designated SEQ

ID:315, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7394] GAM56 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM56 target RNA, herein designated GAM TARGET RNA. GAM56 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7395] GAM56 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM56 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM56 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM56 RNA may have a different number of target

binding sites in untranslated regions of a GAM56 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7396] The complementary binding of GAM56 RNA, herein designated GAM RNA, to target binding sites on GAM56 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM56 target RNA into GAM56 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7397] It is appreciated that GAM56 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM56 target genes. The mRNA of each one of this plurality of GAM56 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM56 RNA, herein designated GAM RNA, and which when bound by GAM56 RNA causes inhibition of translation of respective one or more GAM56 target proteins.

[7398] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM56 gene, herein designated GAM GENE, on one or more GAM56 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7399] It is appreciated that specific functions and accordingly utilities of GAM56 correlate with, and may be deduced from, the identity of the target genes which GAM56 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7400]

[7401]

[7402] Egf-containing fibulin-like extracellular matrix protein 1 (EFEMP1, Accession NM_004105.2) is a GAM56 target gene, herein designated TARGET GENE. EFEMP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EFEMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EFEMP1 BINDING SITE, designated SEQ ID:10550, to the nucleotide sequence of GAM56 RNA, herein designated GAM RNA, also designated SEQ ID:315.

[7403] A function of GAM56 is therefore inhibition of Egf-containing fibulin-like extracellular matrix protein 1 (EFEMP1, Accession NM_004105.2) . Accordingly, utilities of GAM56 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFEMP1.

[7404]

[7405] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 57 (GAM57), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7406] GAM57 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM57 was detected is described hereinabove with reference to Figs. 8-15.

[7407] GAM57 gene, herein designated GAM GENE, and GAM57 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7408] GAM57 gene encodes a GAM57 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM57 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM57 precursor RNA is designated SEQ ID:157, and is provided hereinbelow with reference to the sequence listing part.

[7409] GAM57 precursor RNA folds onto itself, forming GAM57 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[7410] GAM57 precursor RNA folds onto itself, forming GAM57 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7411] Nucleotide sequence of GAM57 precursor RNA, designated SEQ-ID: 157, and a schematic representation of a predicted secondary folding of GAM57 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7412] An enzyme complex designated DICER COMPLEX, `dices` the GAM57 folded precursor RNA into GAM57 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C)

nucleotide sequence of GAM57 RNA is designated SEQ ID:329, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7413] GAM57 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM57 target RNA, herein designated GAM TARGET RNA. GAM57 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7414] GAM57 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM57 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM57 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limit-

ing GAM57 RNA may have a different number of target binding sites in untranslated regions of a GAM57 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7415] The complementary binding of GAM57 RNA, herein designated GAM RNA, to target binding sites on GAM57 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM57 target RNA into GAM57 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7416] It is appreciated that GAM57 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM57 target genes. The mRNA of each one of this plurality of GAM57 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM57 RNA, herein designated GAM RNA, and which when bound by GAM57 RNA causes inhibition of translation of respective one or more GAM57 target proteins.

[7417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM57 gene, herein designated GAM GENE, on one or more GAM57 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7418] It is appreciated that specific functions and accordingly utilities of GAM57 correlate with, and may be deduced from, the identity of the target genes which GAM57 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7419]

[7420]

[7421] LOC253150 (Accession) is a GAM57 target gene, herein designated TARGET GENE. LOC253150 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC253150, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253150 BINDING SITE, designated SEQ ID:14514, to the nucleotide sequence of GAM57 RNA, herein designated GAM RNA, also designated SEQ ID:329.

[7422] A function of GAM57 is therefore inhibition of LOC253150 (Accession) . Accordingly, utilities of GAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253150.

[7423]

[7424] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 58 (GAM58), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7425] GAM58 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method

by which GAM58 was detected is described hereinabove with reference to Figs. 8-15.

[7426] GAM58 gene, herein designated GAM GENE, and GAM58 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7427] GAM58 gene encodes a GAM58 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM58 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM58 precursor RNA is designated SEQ ID:185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:185 is located at position 47201318 relative to chromosome 6.

[7428] GAM58 precursor RNA folds onto itself, forming GAM58 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7429] GAM58 precursor RNA folds onto itself, forming GAM58 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7430] Nucleotide sequence of GAM58 precursor RNA, designated SEQ-ID: 185, and a schematic representation of a predicted secondary folding of GAM58 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7431] An enzyme complex designated DICER COMPLEX, `dices` the GAM58 folded precursor RNA into GAM58 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM58 RNA is designated SEQ

ID:306, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7432] GAM58 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM58 target RNA, herein designated GAM TARGET RNA. GAM58 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7433] GAM58 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM58 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM58 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM58 RNA may have a different number of target

binding sites in untranslated regions of a GAM58 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7434] The complementary binding of GAM58 RNA, herein designated GAM RNA, to target binding sites on GAM58 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM58 target RNA into GAM58 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7435] It is appreciated that GAM58 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM58 target genes. The mRNA of each one of this plurality of GAM58 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM58 RNA, herein designated GAM RNA, and which when bound by GAM58 RNA causes inhibition of translation of respective one or more GAM58 target proteins.

[7436] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM58 gene, herein designated GAM GENE, on one or more GAM58 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7437] It is appreciated that specific functions and accordingly utilities of GAM58 correlate with, and may be deduced from, the identity of the target genes which GAM58 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7438]

[7439]

[7440] Myosin, heavy polypeptide 10, non-muscle (MYH10, Accession XM_290747.2) is a GAM58 target gene, herein designated TARGET GENE. MYH10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MYH10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:6588, to the nucleotide sequence of GAM58 RNA, herein designated GAM RNA, also designated SEQ ID:306.

[7441] A function of GAM58 is therefore inhibition of Myosin, heavy polypeptide 10, non-muscle (MYH10, Accession XM_290747.2) . Accordingly, utilities of GAM58 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10.

[7442] Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NM_138714.2) is another GAM58 target gene, herein designated TARGET GENE. NFAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NFAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:12511, to the nucleotide sequence of GAM58 RNA, herein designated GAM RNA, also designated SEQ ID:306.

[7443] Another function of GAM58 is therefore inhibition of Nuclear factor of activated t-cells 5, tonicity-responsive (NFAT5, Accession NM_138714.2) . Accordingly, utilities of GAM58 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5.

[7444]

[7445] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 59 (GAM59), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7446] GAM59 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM59 was detected is described hereinabove with reference to Figs. 8-15.

[7447] GAM59 gene, herein designated GAM GENE, and GAM59 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7448] GAM59 gene encodes a GAM59 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM59 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM59 precursor RNA is designated SEQ ID:30, and is provided hereinbelow with reference to the sequence listing part.

[7449] GAM59 precursor RNA folds onto itself, forming GAM59 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7450] GAM59 precursor RNA folds onto itself, forming GAM59 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7451] Nucleotide sequence of GAM59 precursor RNA, designated SEQ-ID: 30, and a schematic representation of a predicted secondary folding of GAM59 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7452] An enzyme complex designated DICER COMPLEX, `dices` the GAM59 folded precursor RNA into GAM59 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM59 RNA is designated SEQ ID:377, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7453] GAM59 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM59 target RNA, herein designated GAM TARGET RNA. GAM59 target RNA comprises three regions, as is typical of mRNA of a

protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7454] GAM59 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM59 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM59 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM59 RNA may have a different number of target binding sites in untranslated regions of a GAM59 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7455] The complementary binding of GAM59 RNA, herein desig-

nated GAM RNA, to target binding sites on GAM59 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM59 target RNA into GAM59 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7456] It is appreciated that GAM59 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM59 target genes. The mRNA of each one of this plurality of GAM59 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM59 RNA, herein designated GAM RNA, and which when bound by GAM59 RNA causes inhibition of translation of respective one or more GAM59 target proteins.

[7457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM59 gene, herein designated GAM GENE, on one or more GAM59 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7458] It is appreciated that specific functions and accordingly utilities of GAM59 correlate with, and may be deduced from, the identity of the target genes which GAM59 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7459]

[7460]

[7461] Artemin (ARTN, Accession NM_057091.1) is a GAM59 target gene, herein designated TARGET GENE. ARTN BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ARTN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of ARTN BINDING SITE, designated SEQ ID:13442, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7462] A function of GAM59 is therefore inhibition of Artemin (ARTN, Accession NM_057091.1) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARTN.

[7463] Centaurin, alpha 1 (CENTA1, Accession NM_006869.1) is another GAM59 target gene, herein designated TARGET GENE. CENTA1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CENTA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENTA1 BINDING SITE, designated SEQ ID:7819, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7464] Another function of GAM59 is therefore inhibition of Centaurin, alpha 1 (CENTA1, Accession NM_006869.1) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTA1.

[7465] HYPH (Accession) is another GAM59 target gene, herein

designated TARGET GENE. HYPH BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HYPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HYPH BINDING SITE, designated SEQ ID:11217, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7466] Another function of GAM59 is therefore inhibition of HYPH (Accession) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYPH.

[7467] Potassium channel, subfamily t, member 1 (KCNT1, Accession XM_029962.2) is another GAM59 target gene, herein designated TARGET GENE. KCNT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:13367, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7468] Another function of GAM59 is therefore inhibition of Potassium channel, subfamily t, member 1 (KCNT1, Accession XM_029962.2) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1.

[7469] KIAA1130 (Accession XM_031104.5) is another GAM59 target gene, herein designated TARGET GENE. KIAA1130 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1130, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:19640, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7470] Another function of GAM59 is therefore inhibition of KIAA1130 (Accession XM_031104.5) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130.

[7471] LOC148479 (Accession) is another GAM59 target gene, herein designated TARGET GENE. LOC148479 BINDING SITE is a target binding site found in the 5` untranslated

region of mRNA encoded by LOC148479, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148479 BINDING SITE, designated SEQ ID:16524, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7472] Another function of GAM59 is therefore inhibition of LOC148479 (Accession) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148479.

[7473] LOC220932 (Accession) is another GAM59 target gene, herein designated TARGET GENE. LOC220932 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220932, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220932 BINDING SITE, designated SEQ ID:18057, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7474] Another function of GAM59 is therefore inhibition of LOC220932 (Accession) . Accordingly, utilities of GAM59

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220932.

[7475] LOC221583 (Accession) is another GAM59 target gene, herein designated TARGET GENE. LOC221583 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221583, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221583 BINDING SITE, designated SEQ ID:12315, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7476] Another function of GAM59 is therefore inhibition of LOC221583 (Accession) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221583.

[7477] MGC29643 (Accession NM_144586.1) is another GAM59 target gene, herein designated TARGET GENE. MGC29643 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC29643, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC29643 BINDING SITE, designated SEQ ID:10131, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7478] Another function of GAM59 is therefore inhibition of MGC29643 (Accession NM_144586.1) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29643.

[7479] Paired-like homeodomain transcription factor 1 (PITX1, Accession NM_002653.3) is another GAM59 target gene, herein designated TARGET GENE. PITX1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PITX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PITX1 BINDING SITE, designated SEQ ID:20144, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7480] Another function of GAM59 is therefore inhibition of Paired-like homeodomain transcription factor 1 (PITX1, Accession NM_002653.3), a gene which may regulate gene expression and control cell differentiation. Accord-

ingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITX1.

[7481] The function of PITX1 has been established by previous studies. Pitx1 and Tbx4 (OMIM Ref. No. 601719) encode transcription factors that are expressed throughout the developing hindlimb, but not in forelimb buds. Logan and Tabin (1999) injected a retroviral vector carrying Pitx1 into the wing field of chicken embryos. Misexpression of Pitx1 in the chick wing bud induced distal expression of Tbx4, as well as HoxC10 and HoxC11, which are normally restricted to hindlimb expression domains. Wing buds in which Pitx1 was misexpressed developed into limbs with some morphologic characteristics of hindlimbs: the flexure was altered to that normally observed in legs, the digits were more toe- like in the relative size and shape, and the muscle pattern was transformed to that of a leg. Expression of Tbx5 (OMIM Ref. No. 601620), normally expressed only in the forelimb, was not altered by Pitx1 misexpression. Szeto et al. (1999) found that Pitx1- deleted mice exhibited striking abnormalities in morphogenesis and growth of the hindlimb, resulting in a limb that exhibited structural changes in tibia and fibula as well as

patterning alterations in patella and proximal tarsus, causing the hindlimb to more closely resemble the corresponding forelimb structures. Deletion of the Pitx1 gene resulted in decreased distal expression of the hindlimb-specific marker Tbx4. Pitx1- deleted mice also exhibited reciprocal abnormalities of 2 ventral and 1 dorsal anterior pituitary cell types, presumably on the basis of its synergistic functions with other transcription factors, and defects in the derivatives in the first branchial arch, including cleft palate, suggesting a proliferative defect in these organs analogous to that observed in the hindlimb.

[7482]

[7483] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

O'Connell, S. M.; Liu, F.; Kioussi, C.; Gleiberman, A. S.; Izpisua- Belmonte, J. C.; Rosenfeld, M. G. : Role of the Bi-coid- related home.

[7486] Further studies establishing the function and utilities of PITX1 are found in John Hopkins OMIM database record ID 602149, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-box 6 (TBX6, Accession NM_004608.2) is another GAM59 target gene, herein designated TARGET GENE. TBX6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TBX6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX6 BINDING SITE, designated SEQ ID:19956, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7487] Another function of GAM59 is therefore inhibition of T-box 6 (TBX6, Accession NM_004608.2), a gene which is a probable transcriptional regulator involved in developmental processes. Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX6.

[7488] The function of TBX6 has been established by previous studies. Somites, the segmented mesodermal units of the vertebrate embryo, are the precursors of adult skeletal muscle, bone, and cartilage. During embryogenesis, somite progenitor cells ingress through the primitive streak, move laterally to a paraxial position (alongside the body axis), and segment into epithelial somites. Chapman et al. (1996) described a mouse T- box gene, Tbx6, which codes for a putative DNA- binding protein. The embryonic pattern of expression of Tbx6 in somite precursor cells suggested that this gene may be involved in the specification of paraxial mesoderm. Chapman and Papaioannou (1998) created a mutation in Tbx6 that profoundly affected the differentiation of paraxial mesoderm. Irregular somites formed in the neck region of mutant embryos, whereas more posterior paraxial tissue did not form somites but instead differentiated along a neural pathway, forming neural- tube- like structures that flanked the axial neural tube. These paraxial tubes showed dorsal/ventral patterning that is characteristic of the neural tube and had differentiated motor neurons. These results indicated that Tbx6 is needed for cells to choose between a mesodermal and a neuronal differentiation pathway during

gastrulation; Tbx6 is essential for the specification of posterior paraxial mesoderm, and in its absence cells destined to form posterior somites differentiate along a neuronal pathway. By fluorescence in situ hybridization, Papapetrou et al. (1999) mapped the human TBX6 gene to 16p11.2. This region of chromosome 16 shows homology of synteny with mouse chromosome 7, cM position 61, the localization reported for the mouse Tbx6 gene (Chapman et al., 1996).

[7489]

[7490] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7491] Chapman, D. L.; Agulnik, I.; Hancock, S.; Silver, L. M.; Papaioannou, V. E. : Tbx6, a mouse T- box gene implicated in paraxial mesoderm formation at gastrulation. Dev. Biol. 180: 534- 542, 1996. ; and

[7492] Papapetrou, C.; Putt, W.; Fox, M.; Edwards, Y. H. : The human TBX6 gene: cloning and assignment to chromosome 16p11.2. Genomics 55: 238- 241, 1999.

[7493] Further studies establishing the function and utilities of TBX6 are found in John Hopkins OMIM database record ID 602427, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Yes-associated protein 1, 65kda (YAP1, Accession NM_006106.2) is another GAM59 target gene, herein designated TARGET GENE. YAP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by YAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:7221, to the nucleotide sequence of GAM59 RNA, herein designated GAM RNA, also designated SEQ ID:377.

[7494] Another function of GAM59 is therefore inhibition of Yes-associated protein 1, 65kda (YAP1, Accession NM_006106.2) . Accordingly, utilities of GAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1.

[7495]

[7496] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 60 (GAM60), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7497] GAM60 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM60 was detected is described hereinabove with reference to Figs. 8-15.

[7498] GAM60 gene, herein designated GAM GENE, and GAM60 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7499] GAM60 gene encodes a GAM60 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM60 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM60 precursor RNA is designated SEQ ID:80, and is provided hereinbelow with reference to the sequence listing part.

[7500] GAM60 precursor RNA folds onto itself, forming GAM60 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[7501] GAM60 precursor RNA folds onto itself, forming GAM60 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7502] Nucleotide sequence of GAM60 precursor RNA, designated SEQ-ID: 80, and a schematic representation of a predicted secondary folding of GAM60 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7503] An enzyme complex designated DICER COMPLEX, `dices` the GAM60 folded precursor RNA into GAM60 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C)

nucleotide sequence of GAM60 RNA is designated SEQ ID:381, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7504] GAM60 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM60 target RNA, herein designated GAM TARGET RNA. GAM60 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7505] GAM60 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM60 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM60 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limit-

ing GAM60 RNA may have a different number of target binding sites in untranslated regions of a GAM60 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7506] The complementary binding of GAM60 RNA, herein designated GAM RNA, to target binding sites on GAM60 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM60 target RNA into GAM60 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7507] It is appreciated that GAM60 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM60 target genes. The mRNA of each one of this plurality of GAM60 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM60 RNA, herein designated GAM RNA, and which when bound by GAM60 RNA causes inhibition of translation of respective one or more GAM60 target proteins.

[7508] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM60 gene, herein designated GAM GENE, on one or more GAM60 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7509] It is appreciated that specific functions and accordingly utilities of GAM60 correlate with, and may be deduced from, the identity of the target genes which GAM60 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7510]

[7511]

[7512] Adaptor-related protein complex 1, gamma 2 subunit (AP1G2, Accession NM_080545.1) is a GAM60 target gene, herein designated TARGET GENE. AP1G2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by AP1G2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1G2 BINDING SITE, designated SEQ ID:8669, to the nucleotide sequence of GAM60 RNA, herein designated GAM RNA, also designated SEQ ID:381.

[7513] A function of GAM60 is therefore inhibition of Adaptor-related protein complex 1, gamma 2 subunit (AP1G2, Accession NM_080545.1) . Accordingly, utilities of GAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1G2.

[7514] Brca1 associated ring domain 1 (BARD1, Accession NM_000465.1) is another GAM60 target gene, herein designated TARGET GENE. BARD1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BARD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of BARD1 BINDING SITE, designated SEQ ID:16824, to the nucleotide sequence of GAM60 RNA, herein designated GAM RNA, also designated SEQ ID:381.

[7515] Another function of GAM60 is therefore inhibition of Brca1 associated ring domain 1 (BARD1, Accession NM_000465.1), a gene which involves in mediating tumour suppression by BRCA1 and therefore may be associated with Primary breast, ovarian and uterine cancers. Accordingly, utilities of GAM60 include diagnosis, prevention and treatment of Primary breast, ovarian and uterine cancers, and of other diseases and clinical conditions associated with BARD1.

[7516] The function of BARD1 has been established by previous studies. Kleiman and Manley (1999) demonstrated that the 50- kD subunit of cleavage stimulation factor (CSTF1; 600369) interacts in vitro and in intact cells with BARD1. The BARD1- CSTF1 interaction inhibited polyadenylation in vitro. BARD1, like CSTF1, interacts with RNA polymerase- 2. BARD1, BRCA1, and CSTF1 were shown to associate in vivo. Kleiman and Manley (1999) demonstrated that BARD1 inhibits pre- mRNA 3- prime cleavage in vitro and that the same region of BARD1 required for binding of CSTF1 is necessary for inhibiting 3- prime pre- mRNA

cleavage. Kleiman and Manley (1999) concluded that their results suggested a model in which BARD1, as part of the RNA polymerase- 2 holoenzyme, senses sites of DNA damage and repair, and the inhibitory interaction with CSTF1 ensures that nascent RNAs are not erroneously polyadenylated at such sites. Irminger- Finger et al. (2001) suggested that BARD1 is a mediator of apoptosis because (1) cell death in vivo (ischemic stroke) and in vitro was accompanied by increased levels of BARD1 protein and mRNA; (2) overexpression of BARD1 induced cell death with all features of apoptosis; and (3) BARD1- repressed cells were defective for the apoptotic response to genotoxic stress. The proapoptotic activity of BARD1 involved binding to and elevation of p53 (OMIM Ref. No. 191170). BRCA1 was not required for induction of apoptosis by BARD1 but partially counteracted it. A tumor- associated mutation of BARD1 (glu564 to his) was defective in apoptosis induction, suggesting a role for BARD1 in tumor suppression by mediating the signaling from proapoptotic stress toward induction of apoptosis.

[7517]

[7518] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[7519] Kleiman, F. E.; Manley, J. L. : Functional interaction of BRCA1- associated BARD1 with polyadenylation factor CstF- 50. Science 285: 1576- 1579, 1999. ; and

[7520] Irminger- Finger, I.; Leung, W.- C.; Li, J.; Dubois-Dauphin, M.; Harb, J.; Feki, A.; Jefford, C. E.; Soriano, J. V.; Jaconi, M.; Montesano, R.; Krause, K.- H. : Identification of BARD1 as.

[7521] Further studies establishing the function and utilities of BARD1 are found in John Hopkins OMIM database record ID 601593, and in cited publications listed in Table 5, which are hereby incorporated by reference.HGC6.2 (Accession NM_014356.1) is another GAM60 target gene, herein designated TARGET GENE. HGC6.2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HGC6.2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HGC6.2 BINDING SITE, designated SEQ ID:19650, to the nucleotide sequence of GAM60 RNA, herein designated GAM RNA, also designated SEQ ID:381.

[7522] Another function of GAM60 is therefore inhibition of

HGC6.2 (Accession NM_014356.1) . Accordingly, utilities of GAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGC6.2.

[7523]

[7524] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 61 (GAM61), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7525] GAM61 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM61 was detected is described hereinabove with reference to Figs. 8-15.

[7526] GAM61 gene, herein designated GAM GENE, and GAM61 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7527] GAM61 gene encodes a GAM61 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM61 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM61 precursor RNA is designated SEQ ID:63, and is

provided hereinbelow with reference to the sequence listing part.

[7528] GAM61 precursor RNA folds onto itself, forming GAM61 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7529] GAM61 precursor RNA folds onto itself, forming GAM61 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7530] Nucleotide sequence of GAM61 precursor RNA, designated SEQ-ID: 63, and a schematic representation of a predicted secondary folding of GAM61 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[7531] An enzyme complex designated DICER COMPLEX, `dices` the GAM61 folded precursor RNA into GAM61 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM61 RNA is designated SEQ ID:293, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7532] GAM61 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM61 target RNA, herein designated GAM TARGET RNA. GAM61 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7533] GAM61 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM61 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM61 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM61 RNA may have a different number of target binding sites in untranslated regions of a GAM61 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7534] The complementary binding of GAM61 RNA, herein designated GAM RNA, to target binding sites on GAM61 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM61 target RNA into GAM61 target protein, herein designated GAM TARGET PROTEIN. GAM target

protein is therefore outlined by a broken line.

[7535] It is appreciated that GAM61 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM61 target genes. The mRNA of each one of this plurality of GAM61 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM61 RNA, herein designated GAM RNA, and which when bound by GAM61 RNA causes inhibition of translation of respective one or more GAM61 target proteins.

[7536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM61 gene, herein designated GAM GENE, on one or more GAM61 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7537] It is appreciated that specific functions and accordingly utilities of GAM61 correlate with, and may be deduced from, the identity of the target genes which GAM61 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7538]

[7539]

[7540] Dihydropyrimidinase-like 4 (DPYSL4, Accession NM_006426.1) is a GAM61 target gene, herein designated TARGET GENE. DPYSL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DPYSL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPYSL4 BINDING SITE, designated SEQ ID:9939, to the nucleotide sequence of GAM61 RNA, herein designated GAM RNA, also designated SEQ ID:293.

[7541] A function of GAM61 is therefore inhibition of Dihydropyrimidinase-like 4 (DPYSL4, Accession NM_006426.1) . Ac-

cordingly, utilities of GAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL4.

[7542] LOC197285 (Accession) is another GAM61 target gene, herein designated TARGET GENE. LOC197285 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197285, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197285 BINDING SITE, designated SEQ ID:7360, to the nucleotide sequence of GAM61 RNA, herein designated GAM RNA, also designated SEQ ID:293.

[7543] Another function of GAM61 is therefore inhibition of LOC197285 (Accession) . Accordingly, utilities of GAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197285.

[7544] LOC257458 (Accession) is another GAM61 target gene, herein designated TARGET GENE. LOC257458 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257458, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC257458 BINDING SITE, designated SEQ ID:15784, to the nucleotide sequence of GAM61 RNA, herein designated GAM RNA, also designated SEQ ID:293.

[7545] Another function of GAM61 is therefore inhibition of LOC257458 (Accession) . Accordingly, utilities of GAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257458.

[7546]

[7547] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 62 (GAM62), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7548] GAM62 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM62 was detected is described hereinabove with reference to Figs. 8-15.

[7549] GAM62 gene, herein designated GAM GENE, and GAM62 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7550] GAM62 gene encodes a GAM62 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM62 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM62 precursor RNA is designated SEQ ID:194, and is provided hereinbelow with reference to the sequence listing part.

[7551] GAM62 precursor RNA folds onto itself, forming GAM62 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7552] GAM62 precursor RNA folds onto itself, forming GAM62 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7553] Nucleotide sequence of GAM62 precursor RNA, designated SEQ-ID: 194, and a schematic representation of a predicted secondary folding of GAM62 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7554] An enzyme complex designated DICER COMPLEX, `dices` the GAM62 folded precursor RNA into GAM62 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM62 RNA is designated SEQ ID:220, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7555] GAM62 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM62 target RNA, herein designated GAM TARGET RNA. GAM62 target RNA comprises three regions, as is typical of mRNA of a

protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7556] GAM62 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM62 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM62 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM62 RNA may have a different number of target binding sites in untranslated regions of a GAM62 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7557] The complementary binding of GAM62 RNA, herein desig-

nated GAM RNA, to target binding sites on GAM62 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM62 target RNA into GAM62 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7558] It is appreciated that GAM62 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM62 target genes. The mRNA of each one of this plurality of GAM62 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM62 RNA, herein designated GAM RNA, and which when bound by GAM62 RNA causes inhibition of translation of respective one or more GAM62 target proteins.

[7559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM62 gene, herein designated GAM GENE, on one or more GAM62 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7560] It is appreciated that specific functions and accordingly utilities of GAM62 correlate with, and may be deduced from, the identity of the target genes which GAM62 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7561]

[7562]

[7563] GBL (Accession NM_022372.2) is a GAM62 target gene, herein designated TARGET GENE. GBL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GBL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GBL BINDING SITE, designated

SEQ ID:11551, to the nucleotide sequence of GAM62 RNA, herein designated GAM RNA, also designated SEQ ID:220.

[7564] A function of GAM62 is therefore inhibition of GBL (Accession NM_022372.2) . Accordingly, utilities of GAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBL.

[7565] LOC144395 (Accession XM_084850.1) is another GAM62 target gene, herein designated TARGET GENE. LOC144395 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144395, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144395 BINDING SITE, designated SEQ ID:4572, to the nucleotide sequence of GAM62 RNA, herein designated GAM RNA, also designated SEQ ID:220.

[7566] Another function of GAM62 is therefore inhibition of LOC144395 (Accession XM_084850.1) . Accordingly, utilities of GAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144395.

[7567] Zinc finger protein 141 (clone phz-44) (ZNF141, Accession NM_003441.1) is another GAM62 target gene, herein

designated TARGET GENE. ZNF141 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF141, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF141 BINDING SITE, designated SEQ ID:15865, to the nucleotide sequence of GAM62 RNA, herein designated GAM RNA, also designated SEQ ID:220.

[7568] Another function of GAM62 is therefore inhibition of Zinc finger protein 141 (clone phz-44) (ZNF141, Accession NM_003441.1) . Accordingly, utilities of GAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF141.

[7569]

[7570] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 63 (GAM63), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7571] GAM63 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method

by which GAM63 was detected is described hereinabove with reference to Figs. 8-15.

[7572] GAM63 gene, herein designated GAM GENE, and GAM63 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[7573] GAM63 gene encodes a GAM63 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM63 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM63 precursor RNA is designated SEQ ID:155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:155 is located at position 2 relative to chromosome 3.

[7574] GAM63 precursor RNA folds onto itself, forming GAM63 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7575] GAM63 precursor RNA folds onto itself, forming GAM63 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[7576] Nucleotide sequence of GAM63 precursor RNA, designated SEQ-ID: 155, and a schematic representation of a predicted secondary folding of GAM63 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[7577] An enzyme complex designated DICER COMPLEX, `dices` the GAM63 folded precursor RNA into GAM63 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM63 RNA is designated SEQ

ID:348, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[7578] GAM63 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM63 target RNA, herein designated GAM TARGET RNA. GAM63 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7579] GAM63 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM63 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM63 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM63 RNA may have a different number of target

binding sites in untranslated regions of a GAM63 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7580] The complementary binding of GAM63 RNA, herein designated GAM RNA, to target binding sites on GAM63 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM63 target RNA into GAM63 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7581] It is appreciated that GAM63 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM63 target genes. The mRNA of each one of this plurality of GAM63 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM63 RNA, herein designated GAM RNA, and which when bound by GAM63 RNA causes inhibition of translation of respective one or more GAM63 target proteins.

[7582] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM63 gene, herein designated GAM GENE, on one or more GAM63 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7583] It is appreciated that specific functions and accordingly utilities of GAM63 correlate with, and may be deduced from, the identity of the target genes which GAM63 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7584]

[7585]

[7586] ABCA13 (Accession NP_689914.2) is a GAM63 target gene, herein designated TARGET GENE. ABCA13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABCA13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCA13 BINDING SITE, designated SEQ ID:16335, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7587] A function of GAM63 is therefore inhibition of ABCA13 (Accession NP_689914.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA13.

[7588] V-abl abelson murine leukemia viral oncogene homolog 1 (ABL1, Accession NP_005148.1) is another GAM63 target gene, herein designated TARGET GENE. ABL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABL1 BINDING SITE, designated SEQ ID:820, to

the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7589] Another function of GAM63 is therefore inhibition of V-abl abelson murine leukemia viral oncogene homolog 1 (ABL1, Accession NP_005148.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABL1.

[7590] V-abl abelson murine leukemia viral oncogene homolog 1 (ABL1, Accession NP_009297.1) is another GAM63 target gene, herein designated TARGET GENE. ABL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABL1 BINDING SITE, designated SEQ ID:820, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7591] Another function of GAM63 is therefore inhibition of V-abl abelson murine leukemia viral oncogene homolog 1 (ABL1, Accession NP_009297.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABL1.

[7592] Acid phosphatase 1, soluble (ACP1, Accession NP_009030.1) is another GAM63 target gene, herein designated TARGET GENE. ACP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACP1 BINDING SITE, designated SEQ ID:6377, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7593] Another function of GAM63 is therefore inhibition of Acid phosphatase 1, soluble (ACP1, Accession NP_009030.1), a gene which as demonstrated in starch- gel electrophoresis. and therefore may be associated with Acid phosphatase 1, soluble, a/b polymorphism of. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Acid phosphatase 1, soluble, a/b polymorphism of, and of other diseases and clinical conditions associated with ACP1.

[7594] The function of ACP1 has been established by previous studies. Hopkinson et al. (1963) described a new human polymorphism involving erythrocyte acid phosphatase (EC

3.1.3.2) as demonstrated in starch- gel electrophoresis. Three alleles, P(a), P(b) and P(c), are thought to be involved, their frequency being estimated to be 0.35, 0.60 and 0.05, respectively. Another rare allele, P(r), was described by Giblett and Scott (1965). Mohrenweiser and Novotny (1982) described a low activity variant of ACP1 that is frequent (gene frequency of 0.132) in Guaymi Indians of Central America. Data on gene frequencies of allelic variants were tabulated by Roychoudhury and Nei (1988). Red cells of persons with the GUA- 1 phenotype had increased basal levels of the flavoenzyme glutathione reductase and a larger fraction of the glutathione reductase protein in the form of the holoenzyme, indicating increased levels of flavin adenine dinucleotide in the red cells of these persons. The finding was consistent with the suggestion that ACP1 has a physiologic function as a flavin mononucleotide phosphatase. This function could regulate the intracellular concentrations of flavin coenzymes and, ultimately, of flavoenzymes, and could be the mechanism for the association between ACP1 type and certain disease states. Sensabaugh and Golden (1978) showed that ACP1 is inhibited by folic acid and various folates, and that the inhibition is phenotype dependent:

ACP1(C) more than ACP1(A) more than ACP1(B). This explains elevation of ACP levels in red cells of patients with megaloblastic anemia and also variation in incidence and severity of favism in G6PD- deficient persons. Swallow et al. (1973) showed that 'red cell' acid phosphatase is not limited to erythrocytes but can be demonstrated in other tissues, including cultured fibroblasts and lymphoblastoid cells where there is no possibility of contamination by blood. Dissing et al. (1991) concluded that 2 electrophoretically distinct isozymes, f and s, which are produced in allele- specific ratios and are associated with each of the 3 major alleles, are generated by alternative splicing of the primary RNA transcript. 2. Junien et al. (1979) assigned the ACP1 locus to 2p25. Larson et al. (1982) studied 4 patients who had inherited an unbalanced form of a familial reciprocal translocation, t(2;10)(p24;q26), giving them partial duplication of 2p. Increased levels of acid phosphatase indicated that ACP1 is located in the 2p24- 2pter region and that MDH is not. The previous inconsistency of the SRO (smallest region of overlap) is now resolved; ACP1 is at 2p25. Wo et al. (1992) cloned genes encoding 2 low molecular weight phosphotyrosyl protein phosphatases from a human placenta

cDNA library. They were found to have identical nucleotide sequences, with the exception of a 108- bp segment in the middle of the open reading frame. From further studies they concluded that the 2 represent the fast and slow electrophoretic forms of red cell acid phosphatase and that this enzyme is not unique to the red cell but instead is expressed in all human tissues. They examined a human chromosome 2- specific library and demonstrated that the sequences they were studying are located on chromosome 2.

[7595]

[7596] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7597] Dissing, J.; Johnsen, A. H.; Sensabaugh, G. F. : Human red cell acid phosphatase (ACP1): the amino acid sequence of the two isozymes Bf and Bs encoded by the ACP1*B allele. J. Biol. Chem. 266: 20619- 20625, 1991. ; and

[7598] Wo, Y.- Y. P.; McCormack, A. L.; Shabanowitz, J.; Hunt, D. F.; Davis, J. P.; Mitchell, G. L.; Van Etten, R. L. : Sequencing, cloning, and expression of human red cell- type acid phosphata.

[7599] Further studies establishing the function and utilities of

ACP1 are found in John Hopkins OMIM database record ID 171500, and in cited publications listed in Table 5, which are hereby incorporated by reference.Acid phosphatase 1, soluble (ACP1, Accession NP_004291.1) is another GAM63 target gene, herein designated TARGET GENE. ACP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACP1 BINDING SITE, designated SEQ ID:6377, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7600] Another function of GAM63 is therefore inhibition of Acid phosphatase 1, soluble (ACP1, Accession NP_004291.1), a gene which as demonstrated in starch- gel electrophoresis. and therefore may be associated with Acid phosphatase 1, soluble, a/b polymorphism of. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Acid phosphatase 1, soluble, a/b polymorphism of, and of other diseases and clinical conditions associated with ACP1.

[7601] The function of ACP1 has been established by previous

studies. Hopkinson et al. (1963) described a new human polymorphism involving erythrocyte acid phosphatase (EC 3.1.3.2) as demonstrated in starch- gel electrophoresis. Three alleles, P(a), P(b) and P(c), are thought to be involved, their frequency being estimated to be 0.35, 0.60 and 0.05, respectively. Another rare allele, P(r), was described by Giblett and Scott (1965). [7609]

[7610] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7611] Dissing, J.; Johnsen, A. H.; Sensabaugh, G. F. : Human red cell acid phosphatase (ACP1): the amino acid sequence of the two isozymes Bf and Bs encoded by the ACP1*B allele. J. Biol. Chem. 266: 20619- 20625, 1991. ; and

[7612] Wo, Y.- Y. P.; McCormack, A. L.; Shabanowitz, J.; Hunt, D.

F.; Davis, J. P.; Mitchell, G. L.; Van Etten, R. L. : Sequencing, cloning, and expression of human red cell- type acid phosphata.

[7613] Further studies establishing the function and utilities of ACP1 are found in John Hopkins OMIM database record ID 171500, and in cited publications listed in Table 5, which are hereby incorporated by reference.AD031 (Accession NP_114410.1) is another GAM63 target gene, herein designated TARGET GENE. AD031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AD031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AD031 BINDING SITE, designated SEQ ID:7594, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7614] Another function of GAM63 is therefore inhibition of AD031 (Accession NP_114410.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD031.

[7615] A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NP_001101.1) is another GAM63 target gene, herein designated TARGET GENE. ADAM10 BINDING SITE is

a target binding site found in the 5` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM10 BINDING SITE, designated SEQ ID:10402, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7616] Another function of GAM63 is therefore inhibition of A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NP_001101.1), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM10.

[7617] The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.A disintegrin and metalloproteinase domain 33 (ADAM33, Accession NP_079496.1) is another GAM63 target gene, herein designated TARGET GENE. ADAM33 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM33, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM33 BINDING SITE, designated SEQ ID:15499, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7618] Another function of GAM63 is therefore inhibition of A disintegrin and metalloproteinase domain 33 (ADAM33, Accession NP_079496.1), a gene which may be involved in cell- surface proteolysis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM33.

[7619] The function of ADAM33 has been established by previous studies. ADAM33 is a member of the 'a disintegrin and metalloprotease domain' family of proteins. It is implicated in asthma and bronchial hyperresponsiveness (OMIM Ref. No. 600807). Yoshinaka et al. (2002) isolated mouse and human cDNAs encoding ADAM33. The 813-amino acid human protein shares 70% identity with the mouse protein. ADAM33 has a domain organization identical to that of previously reported members of the ADAM family, and contains the typical zinc- binding consensus sequence in the metalloprotease domain and a pattern of cysteine localization in the EGF- like domain that is typical

of an EGF- like motif. The human protein shows 44% identity with Xenopus ADAM13, 40% with human ADAM19 (OMIM Ref. No. 603640), and 39% with human ADAM12 (OMIM Ref. No. 602714).Yoshinaka et al. (2002) mapped the human ADAM33 gene to chromosome 20p13. Van Eerdewegh et al. (2002) performed a genomewide scan of 460 Caucasian families and identified a locus on chromosome 20p13 that was linked to asthma (OMIM Ref. No. 600807) with a lod score of 2.94 and to bronchial hyperresponsiveness with a lod score of 3.93. A survey of 135 polymorphisms in 23 genes identified the ADAM33 gene as being significantly associated with asthma using case control, transmission disequilibrium, and haplotype analyses (P = 0.04- 0.000003).

[7620]

[7621] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7622] Yoshinaka, T.; Nishii, K.; Yamada, K.; Sawada, H.; Nishiwaki, E.; Smith, K.; Yoshino, K.; Ishiguro, H.; Higashiyama, S. : Identification and characterization of novel mouse and human ADAM33s with potential metalloprotease activity. Gene 282: 227- 236, 2002. ; and

[7623] Van Eerdewegh, P.; Little, R. D.; Dupuis, J.; Del Mastro, R. G.; Falls, K.; Simon, J.; Torrey, D.; Pandit, S.; McKenny, J.; Braunschweiger, K.; Walsh, A.; Liu, Z.; and 26 others : Assoc.

[7624] Further studies establishing the function and utilities of ADAM33 are found in John Hopkins OMIM database record ID 607114, and in cited publications listed in Table 5, which are hereby incorporated by reference.A disintegrin and metalloproteinase domain 33 (ADAM33, Accession NP_694882.1) is another GAM63 target gene, herein designated TARGET GENE. ADAM33 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM33 BINDING SITE, designated SEQ ID:15499, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7625] Another function of GAM63 is therefore inhibition of A disintegrin and metalloproteinase domain 33 (ADAM33, Accession NP_694882.1), a gene which may be involved in cell- surface proteolysis. Accordingly, utilities of GAM63

include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM33.

[7626] The function of ADAM33 has been established by previous studies. ADAM33 is a member of the 'a disintegrin and metalloprotease domain' family of proteins. It is implicated in asthma and bronchial hyperresponsiveness (OMIM Ref. No. 600807). Yoshinaka et al. (2002) isolated mouse and human cDNAs encoding ADAM33. The 813-amino acid human protein shares 70% identity with the mouse protein. [7631] Further studies establishing the function and utilities of ADAM33 are found in John Hopkins OMIM database record ID 607114, and in cited publications listed in Table 5, which are hereby incorporated by reference.1-acylglycerol-3-phosphate o-acyltransferase 1

(lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NP_006402.1) is another GAM63 target gene, herein designated TARGET GENE. AGPAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AGPAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AGPAT1 BINDING SITE, designated SEQ ID:3844, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7632] Another function of GAM63 is therefore inhibition of 1-acylglycerol-3-phosphate o-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NP_006402.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT1.

[7633] 1-acylglycerol-3-phosphate o-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NP_116130.2) is another GAM63 target gene, herein designated TARGET GENE. AGPAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AGPAT1, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AGPAT1 BINDING SITE, designated SEQ ID:3844, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7634] Another function of GAM63 is therefore inhibition of 1-acylglycerol-3-phosphate o-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NP_116130.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT1.

[7635] AIP1 (Accession NP_036433.2) is another GAM63 target gene, herein designated TARGET GENE. AIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AIP1 BINDING SITE, designated SEQ ID:1560, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7636] Another function of GAM63 is therefore inhibition of AIP1

(Accession NP_036433.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIP1.

[7637] Aldehyde dehydrogenase 9 family, member a1 (ALDH9A1, Accession NP_000687.2) is another GAM63 target gene, herein designated TARGET GENE. ALDH9A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALDH9A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALDH9A1 BINDING SITE, designated SEQ ID:19851, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7638] Another function of GAM63 is therefore inhibition of Aldehyde dehydrogenase 9 family, member a1 (ALDH9A1, Accession NP_000687.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH9A1.

[7639] Alkb, alkylation repair homolog (e. coli) (ALKBH, Accession NP_006011.1) is another GAM63 target gene, herein designated TARGET GENE. ALKBH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by ALKBH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALKBH BINDING SITE, designated SEQ ID:14952, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7640] Another function of GAM63 is therefore inhibition of Alkb, alkylation repair homolog (e. coli) (ALKBH, Accession NP_006011.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALKBH.

[7641] Arachidonate 12-lipoxygenase, 12r type (ALOX12B, Accession NP_001130.1) is another GAM63 target gene, herein designated TARGET GENE. ALOX12B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALOX12B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALOX12B BINDING SITE, designated SEQ ID:14007, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7642] Another function of GAM63 is therefore inhibition of

Arachidonate 12-lipoxygenase, 12r type (ALOX12B, Accession NP_001130.1), a gene which converts arachidonic acid to 12r- hydroperoxyeicosatetraenoic acid (12r-hpete). and therefore is associated with Ichthyosiform erythroderma. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Ichthyosiform erythroderma, and of other diseases and clinical conditions associated with ALOX12B.

[7643] The function of ALOX12B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Amyotrophic lateral sclerosis 2 (juvenile) chromosome region, candidate 2 (ALS2CR2, Accession NP_061041.2) is another GAM63 target gene, herein designated TARGET GENE. ALS2CR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALS2CR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALS2CR2 BINDING SITE, designated SEQ ID:968, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7644] Another function of GAM63 is therefore inhibition of Amyotrophic lateral sclerosis 2 (juvenile) chromosome region, candidate 2 (ALS2CR2, Accession NP_061041.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR2.

[7645] Autocrine motility factor receptor (AMFR, Accession NP_001135.3) is another GAM63 target gene, herein designated TARGET GENE. AMFR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AMFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMFR BINDING SITE, designated SEQ ID:1001, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7646] Another function of GAM63 is therefore inhibition of Autocrine motility factor receptor (AMFR, Accession NP_001135.3), a gene which acts to stimulate migration of fibrosarcoma cells and therefore may be associated with Tumors. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Tumors, and of

other diseases and clinical conditions associated with AMFR.

[7647] The function of AMFR has been established by previous studies. Autocrine motility factor (AMF; 172400) is a protein secreted by tumor cells that stimulates tumor motility. Its receptor is a 78- kD glycoprotein (gp78). Watanabe et al. (1991) cloned the AMFR cDNA. The gene encodes a 323- amino acid polypeptide that has a single transmembrane domain and several putative glycosylation sites. The protein sequence has some homology to human tumor protein p53 (OMIM Ref. No. 191170). Hirono et al. (1996) used immunohistochemistry to examine the expression of AMFR in gastric cancer specimens. The level of expression was associated with the pathologic stage and grade of tumor penetration. Positive AMFR expression was significantly associated with poor prognosis.

[7648]

[7649] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7650] Hirono, Y.; Fushida, S.; Yonemura, Y.; Yamamoto, H.; Watanabe, H.; Raz, A. : Expression of autocrine motility factor receptor correlates with disease progression in hu-

man gastric cancer. Brit. J. Cancer 74: 2003- 2007, 1996. ; and

[7651] Watanabe, H.; Carmi, P.; Hogan, V.; Raz, T.; Silletti, S.; Nabi, I. R.; Raz, A. : Purification of human tumor cell autocrine motility factor and molecular cloning of its receptor. J. Bio.

[7652] Further studies establishing the function and utilities of AMFR are found in John Hopkins OMIM database record ID 603243, and in cited publications listed in Table 5, which are hereby incorporated by reference.Autocrine motility factor receptor (AMFR, Accession NP_620408.1) is another GAM63 target gene, herein designated TARGET GENE. AMFR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AMFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMFR BINDING SITE, designated SEQ ID:1001, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7653] Another function of GAM63 is therefore inhibition of Autocrine motility factor receptor (AMFR, Accession NP_620408.1), a gene which acts to stimulate migration

of fibrosarcoma cells and therefore may be associated with Tumors. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Tumors, and of other diseases and clinical conditions associated with AMFR.

[7654] The function of AMFR has been established by previous studies. Autocrine motility factor (AMF; 172400) is a protein secreted by tumor cells that stimulates tumor motility. Its receptor is a 78- kD glycoprotein (gp78). Watanabe et al. (1991) cloned the AMFR cDNA. The gene encodes a 323- amino acid polypeptide that has a single transmembrane domain and several putative glycosylation sites. The protein sequence has some homology to human tumor protein p53 (OMIM Ref. No. 191170). Hirono et al. (1996) used immunohistochemistry to examine the expression of AMFR in gastric cancer specimens. The level of expression was associated with the pathologic stage and grade of tumor penetration. Positive AMFR expression was significantly associated with poor prognosis.

[7655]

[7656] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7657] Hirono, Y.; Fushida, S.; Yonemura, Y.; Yamamoto, H.; Watanabe, H.; Raz, A. : Expression of autocrine motility factor receptor correlates with disease progression in human gastric cancer. Brit. J. Cancer 74: 2003- 2007, 1996. ; and

[7658] Watanabe, H.; Carmi, P.; Hogan, V.; Raz, T.; Silletti, S.; Nabi, I. R.; Raz, A. : Purification of human tumor cell autocrine motility factor and molecular cloning of its receptor. J. Bio.

[7659] Further studies establishing the function and utilities of AMFR are found in John Hopkins OMIM database record ID 603243, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adaptor-related protein complex 1, beta 1 subunit (AP1B1, Accession NP_663782.1) is another GAM63 target gene, herein designated TARGET GENE. AP1B1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1B1 BINDING SITE, designated SEQ ID:9898, to the nucleotide sequence of GAM63 RNA, herein designated GAM

RNA, also designated SEQ ID:348.

[7660] Another function of GAM63 is therefore inhibition of Adaptor-related protein complex 1, beta 1 subunit (AP1B1, Accession NP_663782.1), a gene which plays a role in protein sorting in the late- golgi/trans- golgi network (tgn) and/or endosomes and therefore may be associated with Tumorigenesis of meningiomas. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Tumorigenesis of meningiomas, and of other diseases and clinical conditions associated with AP1B1.

[7661] The function of AP1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.2.Adaptor-related protein complex 1, beta 1 subunit (AP1B1, Accession NP_001118.2) is another GAM63 target gene, herein designated TARGET GENE. AP1B1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1B1 BINDING SITE, designated SEQ ID:9898, to the nucleotide sequence of GAM63 RNA,

herein designated GAM RNA, also designated SEQ ID:348.

[7662] Another function of GAM63 is therefore inhibition of Adaptor-related protein complex 1, beta 1 subunit (AP1B1, Accession NP_001118.2), a gene which plays a role in protein sorting in the late- golgi/trans- golgi network (tgn) and/or endosomes and therefore may be associated with Tumorigenesis of meningiomas. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Tumorigenesis of meningiomas, and of other diseases and clinical conditions associated with AP1B1.

[7663] The function of AP1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.2.Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542118.1) is another GAM63 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:4092, to the nucleotide sequence of GAM63 RNA,

herein designated GAM RNA, also designated SEQ ID:348.

[7664] Another function of GAM63 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NP_542118.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[7665] Apolipoprotein l, 4 (APOL4, Accession NP_085146.2) is another GAM63 target gene, herein designated TARGET GENE. APOL4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by APOL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL4 BINDING SITE, designated SEQ ID:9016, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7666] Another function of GAM63 is therefore inhibition of Apolipoprotein l, 4 (APOL4, Accession NP_085146.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL4.

[7667] Apolipoprotein l, 4 (APOL4, Accession NP_663694.1) is

another GAM63 target gene, herein designated TARGET GENE. APOL4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by APOL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL4 BINDING SITE, designated SEQ ID:9016, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7668] Another function of GAM63 is therefore inhibition of Apolipoprotein l, 4 (APOL4, Accession NP_663694.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL4.

[7669] Ash2 (absent, small, or homeotic)-like (drosophila) (ASH2L, Accession NP_004665.1) is another GAM63 target gene, herein designated TARGET GENE. ASH2L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASH2L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASH2L BIND-

ING SITE, designated SEQ ID:4049, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7670] Another function of GAM63 is therefore inhibition of Ash2 (absent, small, or homeotic)-like (drosophila) (ASH2L, Accession NP_004665.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASH2L.

[7671] Atpase, h+/k+ transporting, nongastric, alpha polypeptide (ATP12A, Accession NP_001667.2) is another GAM63 target gene, herein designated TARGET GENE. ATP12A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP12A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP12A BINDING SITE, designated SEQ ID:6304, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7672] Another function of GAM63 is therefore inhibition of Atpase, h+/k+ transporting, nongastric, alpha polypeptide (ATP12A, Accession NP_001667.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ATP12A.

[7673] Aut-like 2, cysteine endopeptidase (s. cerevisiae) (AUTL2, Accession NP_443168.2) is another GAM63 target gene, herein designated TARGET GENE. AUTL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AUTL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AUTL2 BINDING SITE, designated SEQ ID:914, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7674] Another function of GAM63 is therefore inhibition of Aut-like 2, cysteine endopeptidase (s. cerevisiae) (AUTL2, Accession NP_443168.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL2.

[7675] Aut-like 2, cysteine endopeptidase (s. cerevisiae) (AUTL2, Accession NP_840055.1) is another GAM63 target gene, herein designated TARGET GENE. AUTL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AUTL2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AUTL2 BINDING SITE, designated SEQ ID:914, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7676] Another function of GAM63 is therefore inhibition of Aut-like 2, cysteine endopeptidase (s. cerevisiae) (AUTL2, Accession NP_840055.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL2.

[7677] Aut-like 2, cysteine endopeptidase (s. cerevisiae) (AUTL2, Accession NP_840054.1) is another GAM63 target gene, herein designated TARGET GENE. AUTL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AUTL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AUTL2 BINDING SITE, designated SEQ ID:914, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7678] Another function of GAM63 is therefore inhibition of Aut-like 2, cysteine endopeptidase (s. cerevisiae) (AUTL2, Ac-

cession NP_840054.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL2.

[7679] Bagpipe homeobox homolog 1 (drosophila) (BAPX1, Accession NP_001180.1) is another GAM63 target gene, herein designated TARGET GENE. BAPX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAPX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAPX1 BINDING SITE, designated SEQ ID:17409, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7680] Another function of GAM63 is therefore inhibition of Bagpipe homeobox homolog 1 (drosophila) (BAPX1, Accession NP_001180.1), a gene which regulates gene expression, morphogenesis, and differentiation and therefore may be associated with Ellis- van creveld syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Ellis- van creveld syndrome, and of other diseases and clinical conditions associated with BAPX1.

[7681] The function of BAPX1 has been established by previous

studies. Yoshiura and Murray (1997) reported the sequence of the human homolog of BAPX1 and localized it to human 4p16.1 by linkage mapping on CEPH families with polymorphic markers identified from the genomic sequence near the gene. They suggested the human BAPX1 gene as a candidate gene for disorders of skeletal development that map to 4p16.1, such as Ellis- van Creveld syndrome (OMIM Ref. No. 225500). Tribioli and Lufkin (1997) cloned the BAPX1 gene by screening a human genomic placenta library with a genomic fragment of the mouse gene. The predicted 333- amino acid sequence of the human gene product had 85% overall identity to the product of the murine gene, with 100% identity in the homeodomain. By fluorescence in situ hybridization, they mapped the BAPX1 gene to 4p16.1 in a region of syntenic homology with mouse chromosome 5 where the mouse gene had been mapped. RT- PCR analysis demonstrated that BAPX1 is expressed in embryonic tissues, particularly the limb, and at a lower level in an embryonic lung cell line. RNA in situ hybridization showed that BAPX1 is predominantly expressed in mesenchymal condensations of the fetal limb and axial skeleton, and in lateral plate mesoderm giving rise to visceral muscle. Tribioli et al.

(1997) showed that expression of Bapx1 is first detectable in embryos just before axis rotation in lateral plate mesoderm (splanchnic mesoderm) adjacent to the endodermal lining of the prospective gut, and in the most newly formed somites in the region corresponding to the presclerotome, the precursor of the vertebrae. Thus, Bapx1 is one of the earliest developmental markers for the sclerotome portion of the somite and the gut mesentery. Bapx1 continues to be expressed well into organogenesis in lateral plate mesoderm surrounding the mid- and hindgut, and in essentially all cartilaginous condensations that will subsequently undergo endochondral bone formation.

[7682]

[7683] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7684] Yoshiura, K.- I.; Murray, J. C. : Sequence and chromosomal assignment of human BAPX1, a bagpipe- related gene, to 4p16.1: a candidate gene for skeletal dysplasia. Genomics 45: 425- 428, 1997. ; and

[7685] Tribioli, C.; Frasch, M.; Lufkin, T. : Bapx1: an evolutionary conserved homologue of the Drosophila bagpipe home-

obox gene is expressed in splanchnic mesoderm and the embryonic skeleton.

[7686] Further studies establishing the function and utilities of BAPX1 are found in John Hopkins OMIM database record ID 602183, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hla-b associated transcript 8 (BAT8, Accession NP_006700.2) is another GAM63 target gene, herein designated TARGET GENE. BAT8 BINDING SITE1 and BAT8 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BAT8, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAT8 BINDING SITE1 and BAT8 BINDING SITE2, designated SEQ ID:16535 and SEQ ID:17987 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7687] Another function of GAM63 is therefore inhibition of Hla-b associated transcript 8 (BAT8, Accession NP_006700.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAT8.

[7688] Hla-b associated transcript 8 (BAT8, Accession NP_006700.2) is another GAM63 target gene, herein designated TARGET GENE. BAT8 BINDING SITE1 and BAT8 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BAT8, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAT8 BINDING SITE1 and BAT8 BINDING SITE2, designated SEQ ID:17987 and SEQ ID:16535 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7689] Another function of GAM63 is therefore inhibition of Hla-b associated transcript 8 (BAT8, Accession NP_006700.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAT8.

[7690] Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) is another GAM63 target gene, herein designated TARGET GENE. BAZ2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAZ2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAZ2A BINDING SITE, designated SEQ ID:2148, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7691] Another function of GAM63 is therefore inhibition of Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2A.

[7692] BLAME (Accession NP_064510.1) is another GAM63 target gene, herein designated TARGET GENE. BLAME BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BLAME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:10762, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7693] Another function of GAM63 is therefore inhibition of BLAME (Accession NP_064510.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with BLAME.

[7694] BMF (Accession NP_277038.1) is another GAM63 target gene, herein designated TARGET GENE. BMF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BMF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:13024, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7695] Another function of GAM63 is therefore inhibition of BMF (Accession NP_277038.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF.

[7696] Bone morphogenetic protein 1 (BMP1, Accession NP_001190.1) is another GAM63 target gene, herein designated TARGET GENE. BMP1 BINDING SITE1 and BMP1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BMP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of BMP1 BINDING SITE1 and BMP1 BINDING SITE2, designated SEQ ID:10746 and SEQ ID:10746 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7697] Another function of GAM63 is therefore inhibition of Bone morphogenetic protein 1 (BMP1, Accession NP_001190.1), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1.

[7698] The function of BMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.Bone morphogenetic protein 1 (BMP1, Accession NP_006122.1) is another GAM63 target gene, herein designated TARGET GENE. BMP1 BINDING SITE1 and BMP1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BMP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMP1 BINDING SITE1 and BMP1

BINDING SITE2, designated SEQ ID:16512 and SEQ ID:2992 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7699] Another function of GAM63 is therefore inhibition of Bone morphogenetic protein 1 (BMP1, Accession NP_006122.1), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1.

[7700] The function of BMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.C10orf5 (Accession NP_848931.1) is another GAM63 target gene, herein designated TARGET GENE. C10orf5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C10orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C10orf5 BINDING SITE, designated SEQ ID:19283, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7701] Another function of GAM63 is therefore inhibition of C10orf5 (Accession NP_848931.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C10orf5.

[7702] Chromosome 14 open reading frame 1 (C14orf1, Accession NP_009107.1) is another GAM63 target gene, herein designated TARGET GENE. C14orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:8879, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7703] Another function of GAM63 is therefore inhibition of Chromosome 14 open reading frame 1 (C14orf1, Accession NP_009107.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1.

[7704] C14orf102 (Accession NP_060440.1) is another GAM63 target gene, herein designated TARGET GENE. C14orf102 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by C14orf102, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf102 BINDING SITE, designated SEQ ID:9576, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7705] Another function of GAM63 is therefore inhibition of C14orf102 (Accession NP_060440.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf102.

[7706] C14orf132 (Accession NP_064600.1) is another GAM63 target gene, herein designated TARGET GENE. C14orf132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf132 BINDING SITE, designated SEQ ID:8516, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7707] Another function of GAM63 is therefore inhibition of

C14orf132 (Accession NP_064600.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf132.

[7708] Chromosome 16 open reading frame 7 (C16orf7, Accession NP_004904.1) is another GAM63 target gene, herein designated TARGET GENE. C16orf7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C16orf7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C16orf7 BINDING SITE, designated SEQ ID:5690, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7709] Another function of GAM63 is therefore inhibition of Chromosome 16 open reading frame 7 (C16orf7, Accession NP_004904.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf7.

[7710] Chromosome 1 open reading frame 21 (C1orf21, Accession NP_110433.1) is another GAM63 target gene, herein designated TARGET GENE. C1orf21 BINDING SITE is a tar-

get binding site found in the 3` untranslated region of mRNA encoded by C1orf21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf21 BINDING SITE, designated SEQ ID:13283, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7711] Another function of GAM63 is therefore inhibition of Chromosome 1 open reading frame 21 (C1orf21, Accession NP_110433.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf21.

[7712] Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) is another GAM63 target gene, herein designated TARGET GENE. C1orf24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C1orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:17211, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[7713] Another function of GAM63 is therefore inhibition of Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24.

[7714] Chromosome 1 open reading frame 6 (C1orf6, Accession NP_064516.1) is another GAM63 target gene, herein designated TARGET GENE. C1orf6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf6 BINDING SITE, designated SEQ ID:1257, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7715] Another function of GAM63 is therefore inhibition of Chromosome 1 open reading frame 6 (C1orf6, Accession NP_064516.1), a gene which may link ataxin- 1 with the chaperone and ubiquitin/proteasome pathways . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf6.

[7716] The function of C1orf6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) is another GAM63 target gene, herein designated TARGET GENE. C1QR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:7246, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7717] Another function of GAM63 is therefore inhibition of Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1.

[7718] Complement component 2 (C2, Accession NP_000054.2) is another GAM63 target gene, herein designated TARGET GENE. C2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C2, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C2 BINDING SITE, designated SEQ ID:540, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7719] Another function of GAM63 is therefore inhibition of Complement component 2 (C2, Accession NP_000054.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C2.

[7720] Chromosome 20 open reading frame 116 (C20orf116, Accession NP_076424.1) is another GAM63 target gene, herein designated TARGET GENE. C20orf116 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf116, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf116 BINDING SITE, designated SEQ ID:13238, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7721] Another function of GAM63 is therefore inhibition of

Chromosome 20 open reading frame 116 (C20orf116, Accession NP_076424.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf116.

[7722] Chromosome 20 open reading frame 140 (C20orf140, Accession NP_653229.1) is another GAM63 target gene, herein designated TARGET GENE. C20orf140 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C20orf140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf140 BINDING SITE, designated SEQ ID:1272, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7723] Another function of GAM63 is therefore inhibition of Chromosome 20 open reading frame 140 (C20orf140, Accession NP_653229.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf140.

[7724] Chromosome 20 open reading frame 169 (C20orf169, Accession NP_291020.1) is another GAM63 target gene, herein designated TARGET GENE. C20orf169 BINDING SITE

is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf169 BINDING SITE, designated SEQ ID:15267, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7725] Another function of GAM63 is therefore inhibition of Chromosome 20 open reading frame 169 (C20orf169, Accession NP_291020.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf169.

[7726] Chromosome 20 open reading frame 98 (C20orf98, Accession NP_079234.1) is another GAM63 target gene, herein designated TARGET GENE. C20orf98 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf98, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf98 BINDING SITE, designated SEQ ID:15768, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA,

also designated SEQ ID:348.

[7727] Another function of GAM63 is therefore inhibition of Chromosome 20 open reading frame 98 (C20orf98, Accession NP_079234.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf98.

[7728] Chromosome 21 open reading frame 93 (C21orf93, Accession NP_660162.1) is another GAM63 target gene, herein designated TARGET GENE. C21orf93 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf93, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf93 BINDING SITE, designated SEQ ID:20078, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7729] Another function of GAM63 is therefore inhibition of Chromosome 21 open reading frame 93 (C21orf93, Accession NP_660162.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf93.

[7730] Chromosome 22 open reading frame 5 (C22orf5, Acces-

sion NP_036396.1) is another GAM63 target gene, herein designated TARGET GENE. C22orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C22orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C22orf5 BINDING SITE, designated SEQ ID:4323, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7731] Another function of GAM63 is therefore inhibition of Chromosome 22 open reading frame 5 (C22orf5, Accession NP_036396.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf5.

[7732] Complement component 3 (C3, Accession NP_000055.1) is another GAM63 target gene, herein designated TARGET GENE. C3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C3 BINDING SITE, designated SEQ ID:3699, to the nu-

cleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7733] Another function of GAM63 is therefore inhibition of Complement component 3 (C3, Accession NP_000055.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3.

[7734] C3F (Accession NP_005759.2) is another GAM63 target gene, herein designated TARGET GENE. C3F BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C3F, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C3F BINDING SITE, designated SEQ ID:15076, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7735] Another function of GAM63 is therefore inhibition of C3F (Accession NP_005759.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3F.

[7736] C6orf136 (Accession NP_659466.1) is another GAM63 target gene, herein designated TARGET GENE. C6orf136

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C6orf136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf136 BINDING SITE, designated SEQ ID:7531, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7737] Another function of GAM63 is therefore inhibition of C6orf136 (Accession NP_659466.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf136.

[7738] C6orf67 (Accession NP_060717.1) is another GAM63 target gene, herein designated TARGET GENE. C6orf67 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf67, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf67 BINDING SITE, designated SEQ ID:5174, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7739] Another function of GAM63 is therefore inhibition of

C6orf67 (Accession NP_060717.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf67.

[7740] CAB2 (Accession NP_219487.2) is another GAM63 target gene, herein designated TARGET GENE. CAB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAB2 BINDING SITE, designated SEQ ID:12488, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7741] Another function of GAM63 is therefore inhibition of CAB2 (Accession NP_219487.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAB2.

[7742] Calcium channel, voltage-dependent, gamma subunit 6 (CACNG6, Accession NP_665814.1) is another GAM63 target gene, herein designated TARGET GENE. CACNG6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CACNG6, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CACNG6 BINDING SITE, designated SEQ ID:11907, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7743] Another function of GAM63 is therefore inhibition of Calcium channel, voltage-dependent, gamma subunit 6 (CACNG6, Accession NP_665814.1), a gene which plays a role in excitation- contraction coupling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG6.

[7744] The function of CACNG6 has been established by previous studies. Voltage- dependent calcium channels couple membrane depolarization in a number of cellular processes. These activities are regulated by distinct channels composed of the pore- forming alpha- 1 (e.g., CACNA1D; 114206) subunit and the modulatory beta (e.g., CACNB1; 114207), alpha- 2/delta (e.g., CACNA2D1; 114204), and gamma (e.g., CACNG1; 114209) subunits. By RT- PCR and genomic sequence analysis, Burgess et al. (2001) determined that the CACNG6 gene, like CACNG7 and CACNG8, contains 4 exons. A potential splice variant lacking exon 3

would eliminate 2 transmembrane domains.

[7745]

[7746] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7747] Burgess, D. L.; Gefrides, L. A.; Foreman, P. J.; Noebels, J. L. : A cluster of three novel Ca(2+) channel gamma subunit genes on chromosome 19q13.4: evolution and expression profile of the gamma subunit gene family. Genomics 71: 339- 350, 2001. ; and

[7748] Chu, P.- J.; Robertson, H. M.; Best, P. M. : Calcium channel gamma subunits provide insights into the evolution of this gene family. Gene 280: 37- 48, 2001.

[7749] Further studies establishing the function and utilities of CACNG6 are found in John Hopkins OMIM database record ID 606898, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calcium channel, voltage-dependent, gamma subunit 6 (CACNG6, Accession NP_665813.1) is another GAM63 target gene, herein designated TARGET GENE. CACNG6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CACNG6, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CACNG6 BINDING SITE, designated SEQ ID:11907, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7750] Another function of GAM63 is therefore inhibition of Calcium channel, voltage-dependent, gamma subunit 6 (CACNG6, Accession NP_665813.1), a gene which plays a role in excitation- contraction coupling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG6.

[7751] The function of CACNG6 has been established by previous studies. Voltage- dependent calcium channels couple membrane depolarization in a number of cellular processes. These activities are regulated by distinct channels composed of the pore- forming alpha- 1 (e.g., CACNA1D; 114206) subunit and the modulatory beta (e.g., CACNB1; 114207), alpha- 2/delta (e.g., CACNA2D1; 114204), and gamma (e.g., CACNG1; 114209) subunits. By RT- PCR and genomic sequence analysis, Burgess et al. (2001) determined that the CACNG6 gene, like CACNG7 and CACNG8, contains 4 exons. A potential splice variant lacking exon 3

would eliminate 2 transmembrane domains.

[7752]

[7753] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7754] Burgess, D. L.; Gefrides, L. A.; Foreman, P. J.; Noebels, J. L. : A cluster of three novel Ca(2+) channel gamma subunit genes on chromosome 19q13.4: evolution and expression profile of the gamma subunit gene family. Genomics 71: 339- 350, 2001. ; and

[7755] Chu, P.- J.; Robertson, H. M.; Best, P. M. : Calcium channel gamma subunits provide insights into the evolution of this gene family. Gene 280: 37- 48, 2001.

[7756] Further studies establishing the function and utilities of CACNG6 are found in John Hopkins OMIM database record ID 606898, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calcium channel, voltage-dependent, gamma subunit 6 (CACNG6, Accession NP_114103.2) is another GAM63 target gene, herein designated TARGET GENE. CACNG6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CACNG6, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CACNG6 BINDING SITE, designated SEQ ID:11907, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7757] Another function of GAM63 is therefore inhibition of Calcium channel, voltage-dependent, gamma subunit 6 (CACNG6, Accession NP_114103.2), a gene which plays a role in excitation- contraction coupling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG6.

[7758] The function of CACNG6 has been established by previous studies. Voltage- dependent calcium channels couple membrane depolarization in a number of cellular processes. These activities are regulated by distinct channels composed of the pore- forming alpha- 1 (e.g., CACNA1D; 114206) subunit and the modulatory beta (e.g., CACNB1; 114207), alpha- 2/delta (e.g., CACNA2D1; 114204), and gamma (e.g., CACNG1; 114209) subunits. By RT- PCR and genomic sequence analysis, Burgess et al. (2001) determined that the CACNG6 gene, like CACNG7 and CACNG8, contains 4 exons. A potential splice variant lacking exon 3

would eliminate 2 transmembrane domains.

[7759]

[7760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7761] Burgess, D. L.; Gefrides, L. A.; Foreman, P. J.; Noebels, J. L. : A cluster of three novel Ca(2+) channel gamma subunit genes on chromosome 19q13.4: evolution and expression profile of the gamma subunit gene family. Genomics 71: 339- 350, 2001. ; and

[7762] Chu, P.- J.; Robertson, H. M.; Best, P. M. : Calcium channel gamma subunits provide insights into the evolution of this gene family. Gene 280: 37- 48, 2001.

[7763] Further studies establishing the function and utilities of CACNG6 are found in John Hopkins OMIM database record ID 606898, and in cited publications listed in Table 5, which are hereby incorporated by refer- ence.Calcium/calmodulin-dependent protein kinase ki- nase 1, alpha (CAMKK1, Accession NP_115670.1) is an- other GAM63 target gene, herein designated TARGET GENE. CAMKK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK1, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:5691, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7764] Another function of GAM63 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 1, alpha (CAMKK1, Accession NP_115670.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1.

[7765] Calcium/calmodulin-dependent protein kinase kinase 1, alpha (CAMKK1, Accession NP_757343.1) is another GAM63 target gene, herein designated TARGET GENE. CAMKK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:5691, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated

SEQ ID:348.

[7766] Another function of GAM63 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 1, alpha (CAMKK1, Accession NP_757343.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1.

[7767] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757365.1) is another GAM63 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:14352, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7768] Another function of GAM63 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757365.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with CAMKK2.

[7769] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_006540.3) is another GAM63 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:14352, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7770] Another function of GAM63 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_006540.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[7771] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757380.1) is another GAM63 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA

encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:14352, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7772] Another function of GAM63 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_757380.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[7773] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705719.2) is another GAM63 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:14352, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated

SEQ ID:348.

[7774] Another function of GAM63 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705719.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[7775] Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705720.1) is another GAM63 target gene, herein designated TARGET GENE. CAMKK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CAMKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:14352, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7776] Another function of GAM63 is therefore inhibition of Calcium/calmodulin-dependent protein kinase kinase 2, beta (CAMKK2, Accession NP_705720.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2.

[7777] CAP350 (Accession NP_055625.2) is another GAM63 target gene, herein designated TARGET GENE. CAP350 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAP350, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:19295, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7778] Another function of GAM63 is therefore inhibition of CAP350 (Accession NP_055625.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350.

[7779] Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1) is another GAM63 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BIND-

ING SITE, designated SEQ ID:9720, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7780] Another function of GAM63 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[7781] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1) is another GAM63 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:9720, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7782] Another function of GAM63 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[7783] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.Chromobox homolog 7 (CBX7, Accession NP_783640.1) is another GAM63 target gene, herein designated TARGET GENE. CBX7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CBX7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBX7 BINDING SITE, designated SEQ ID:8537, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7784] Another function of GAM63 is therefore inhibition of

Chromobox homolog 7 (CBX7, Accession NP_783640.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX7.

[7785] Cyclin h (CCNH, Accession NP_001230.1) is another GAM63 target gene, herein designated TARGET GENE. CCNH BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CCNH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNH BINDING SITE, designated SEQ ID:13215, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7786] Another function of GAM63 is therefore inhibition of Cyclin h (CCNH, Accession NP_001230.1), a gene which phosphorylates and thus activates certain cyclin- dependent protein kinases in the regulation of cell cycle progression. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNH.

[7787] The function of CCNH has been established by previous studies. The cdk- activating kinase (CAK) is a multi- sub-

unit protein which phosphorylates and thus activates certain cyclin- dependent protein kinases in the regulation of cell cycle progression. Fisher and Morgan (1994) purified mammalian CAK and found that it was composed of 2 major polypeptides, a 37- kD cyclin termed cyclin H and a 42- kD cyclin- dependent kinase (CDK7; 601955). Fisher and Morgan (1994) cloned the cyclin H gene encoding a 323- amino acid polypeptide homologous to STK1 (CDK7) and Xenopus MO15, a cell cycle- associated kinase. The authors reported that a reconstituted cyclin H/CDK7 complex was able to phosphorylate CDK2 (OMIM Ref. No. 116953) and CDC2 (OMIM Ref. No. 116940) in vitro. Mammalian CDK8 (OMIM Ref. No. 603184) and cyclin C (OMIM Ref. No. 123838) are components of the RNA polymerase II holoenzyme complex, where they function as a protein kinase that phosphorylates the C- terminal domain of the largest subunit of RNA polymerase II. The CDK8/cyclin C protein complex is also found in a number of mammalian 'Mediator'- like protein complexes, which repress activated transcription independently of the C-terminal domain in vitro. Akoulitchev et al. (2000) demonstrated that CDK8/cyclin C can regulate transcription by targeting the CDK7/cyclin H subunits of TFIIH. CDK8

phosphorylates mammalian cyclin H at serine 5 and serine 304 both in vitro and in vivo, in the vicinity of its functionally unique N- and C- terminal alpha- helical domains. This phosphorylation represses both the ability of TFIIH to activate transcription and its C- terminal kinase activity. In addition, mimicking CDK8 phosphorylation of cyclin H in vivo has a dominant- negative effect on cell growth. Akoulitchev et al. (2000) concluded that their results linked the Mediator complex and the basal transcription machinery by a regulatory pathway involving 2 cyclin- dependent kinases. This pathway appears to be unique to higher organisms.

[7788]

[7789] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7790] Fisher, R. P.; Morgan, D. O. : A novel cyclin associates with MO15/CDK7 to form the CDK- activating kinase. Cell 78: 713- 724, 1994. ; and

[7791] Akoulitchev, S.; Chuikov, S.; Reinberg, D. : TFIIH is negatively regulated by cdk8- containing mediator complexes. Nature 407: 102- 106, 2000.

[7792] Further studies establishing the function and utilities of

CCNH are found in John Hopkins OMIM database record ID 601953, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-c motif) receptor 7 (CCR7, Accession NP_001829.1) is another GAM63 target gene, herein designated TARGET GENE. CCR7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCR7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR7 BINDING SITE, designated SEQ ID:19038, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7793] Another function of GAM63 is therefore inhibition of Chemokine (c-c motif) receptor 7 (CCR7, Accession NP_001829.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR7.

[7794] Cd2-associated protein (CD2AP, Accession NP_036252.1) is another GAM63 target gene, herein designated TARGET GENE. CD2AP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CD2AP, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD2AP BINDING SITE, designated SEQ ID:12070, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7795] Another function of GAM63 is therefore inhibition of Cd2-associated protein (CD2AP, Accession NP_036252.1), a gene which binds CAS ligand and may therefor involves in its growth regulatory pathway. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD2AP.

[7796] The function of CD2AP has been established by previous studies. P130(Cas) (OMIM Ref. No. 602941) is a docking protein that is tyrosine- phosphorylated in response to a variety of extracellular stimuli, such as growth factors, cell- cell interaction, and cell- matrix interaction, and appears to play a critical role in the integrin- linked formation of focal complexes. To understand the growth regulatory pathway of p130(Cas), Kirsch et al. (1999) used the yeast 2- hybrid system to search for interacting molecules. They identified a human protein, which they called CMS for p130(Cas) ligand with multiple SH3 domains, as a direct binding protein of p130(Cas). CMS is a

multifunctional adapter- type molecule, which is localized in the cytoplasm, membrane ruffles, and leading edges of cells. Its structure and colocalization with F- actin (see OMIM Ref. No. 102610) and p130(Cas) suggested a function as a scaffolding protein involved in the dynamic regulation of the actin cytoskeleton. The cDNA corresponding to CMS encodes a protein of 639 amino acids with a deduced molecular mass of approximately 70 kD. Amino acid analysis revealed that CMS contains in its N terminus 3 SH3 domains followed by a proline- rich region containing binding sites for SH3 domains. Putative actin- binding sites and a coiled- coil domain are located at the C terminus of the protein, which also contains a putative leucine zipper motif. CMS mRNA is ubiquitously expressed in adult and fetal human tissues as an approximately 5.4- kb transcript, as detected by Northern blot analysis. CMS induces vesicle formation and colocalizes with p130(Cas) and F- actin to membrane ruffles. It also associates with and is phosphorylated by tyrosine kinases. Kirsch et al. (1999) demonstrated that CMS is able to homodimerize through the coiled- coil domain located in its C terminus. There was no evidence for intermolecular or intramolecular binding via the SH3 domains and PXXP binding.

[7797] Animal model experiments lend further support to the function of CD2AP. Shih et al. (1999) generated mice lacking CD2AP by targeted disruption. In CD2AP- deficient mice, immune function was compromised, but the mice died from renal failure at 6 to 7 weeks of age. In the kidney, CD2AP was expressed primarily in glomerular epithelial cells. Knockout mice exhibited defects in epithelial cell foot processes, accompanied by mesangial cell hyperplasia and extracellular matrix deposition. CD2AP associated with nephrin (OMIM Ref. No. 602716), which is the primary component of the slit diaphragm. This observation supports a role for CD2AP in this specialized cell junction.

[7798] It is appreciated that the abovementioned animal model for CD2AP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7799] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7800] Kirsch, K. H.; Georgescu, M.- M.; Ishimaru, S.; Hanafusa, H. : CMS: an adapter molecule involved in cytoskeletal rearrangements. Proc. Nat. Acad. Sci. 96: 6211- 6216, 1999. ; and

[7801] Shih, N.- Y.; Li, J.; Karpitskii, V.; Nguyen, A.; Dustin, M. L.; Kanagawa, O.; Miner, J. H.; Shaw, A. S. : Congenital nephrotic syndrome in mice lacking CD2- associated protein. Science 2.

[7802] Further studies establishing the function and utilities of CD2AP are found in John Hopkins OMIM database record ID 604241, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd37 antigen (CD37, Accession NP_001765.1) is another GAM63 target gene, herein designated TARGET GENE. CD37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD37 BINDING SITE, designated SEQ ID:19108, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7803] Another function of GAM63 is therefore inhibition of Cd37 antigen (CD37, Accession NP_001765.1), a gene which is expressed on leukocytes and has been implicated in signal transduction, cell- cell interactions, and cellular activation and development. Accordingly, utilities of GAM63

include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD37.

[7804] The function of CD37 has been established by previous studies. CD37 is a membrane protein of the tetraspanin superfamily, which includes CD9 (OMIM Ref. No. 143030), CD53 (OMIM Ref. No. 151525), CD81 (OMIM Ref. No. 186845), and the R2 antigen (KAI1; 600623) among others. Many of these molecules are expressed on leukocytes and have been implicated in signal transduction, cell- cell interactions, and cellular activation and development. Virtaneva et al. (1993) found that the CD37, CD53, and KAI1 proteins have 4 hydrophobic membrane- spanning regions and a single major extracellular loop. Both N- and C- termini of the polypeptides are probably located in the cytoplasm. The 3 antigens appear to have a higher sequence similarity (33%) to each other than to other members of the family. The CD37 antigen is strongly expressed on the surface of B cells and only weakly on a subpopulation of T cells. The CD53 glycoprotein is a panleukocyte marker widely expressed on hemopoietic cells. The R2 antigen appears to be upregulated in activated T cells. By study of human/rodent somatic cell hybrids, Virtaneva et al. (1993) demonstrated that these 3 similar

antigens are encoded by genes on distinct chromosomes; CD37 mapped to 19p13- q13.4, CD53 to 1p31- p12, and R2 to 11p12.

[7805]

[7806] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7807] Knobeloch, K.- P.; Wright, M. D.; Ochsenbein, A. F.; Liesenfeld, O.; Lohler, J.; Zinkernagel, R. M.; Horak, I.; Orinska, Z. : Targeted inactivation of the tetraspanin CD37 impairs T- cell- dependent B- cell response under subop- timal costimulatory conditions. Molec. Cell. Biol. 20: 5363- 5369, 2000. ; and

[7808] Virtaneva, K. I.; Angelisova, P.; Baumruker, T.; Horejsi, V.; Nevanlinna, H.; Schroder, J. : The genes for CD37, CD53, and R2, all members of a novel gene family, are located on differ.

[7809] Further studies establishing the function and utilities of CD37 are found in John Hopkins OMIM database record ID 151523, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd8 antigen, beta polypeptide 1 (p37) (CD8B1, Accession NP_742097.1) is another GAM63 target gene, herein designated TARGET

GENE. CD8B1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD8B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD8B1 BINDING SITE, designated SEQ ID:13025, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7810] Another function of GAM63 is therefore inhibition of Cd8 antigen, beta polypeptide 1 (p37) (CD8B1, Accession NP_742097.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD8B1.

[7811] Cd8 antigen, beta polypeptide 1 (p37) (CD8B1, Accession NP_004922.1) is another GAM63 target gene, herein designated TARGET GENE. CD8B1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD8B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD8B1 BINDING SITE, designated SEQ ID:13025, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7812] Another function of GAM63 is therefore inhibition of Cd8 antigen, beta polypeptide 1 (p37) (CD8B1, Accession NP_004922.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD8B1.

[7813] Cell division cycle 42 (gtp binding protein, 25kda) (CDC42, Accession NP_001782.1) is another GAM63 target gene, herein designated TARGET GENE. CDC42 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC42, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC42 BINDING SITE, designated SEQ ID:5028, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7814] Another function of GAM63 is therefore inhibition of Cell division cycle 42 (gtp binding protein, 25kda) (CDC42, Accession NP_001782.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42.

[7815] Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_803124.1) is another GAM63 target gene, herein designated TARGET GENE. CECR1 BINDING SITE1 and CECR1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CECR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE1 and CECR1 BINDING SITE2, designated SEQ ID:8125 and SEQ ID:8928 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7816] Another function of GAM63 is therefore inhibition of Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_803124.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1.

[7817] Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_059120.2) is another GAM63 target gene, herein designated TARGET GENE. CECR1 BINDING SITE1 and CECR1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of

mRNA encoded by CECR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE1 and CECR1 BINDING SITE2, designated SEQ ID:8125 and SEQ ID:8928 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7818] Another function of GAM63 is therefore inhibition of Cat eye syndrome chromosome region, candidate 1 (CECR1, Accession NP_059120.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1.

[7819] Cadherin, egf lag seven-pass g-type receptor 2 (flamingo homolog, drosophila) (CELSR2, Accession NP_001399.1) is another GAM63 target gene, herein designated TARGET GENE. CELSR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CELSR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CELSR2 BINDING SITE, designated SEQ ID:2706, to the nucleotide sequence of GAM63 RNA,

herein designated GAM RNA, also designated SEQ ID:348.

[7820] Another function of GAM63 is therefore inhibition of Cadherin, egf lag seven-pass g-type receptor 2 (flamingo homolog, drosophila) (CELSR2, Accession NP_001399.1), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR2.

[7821] The function of CELSR2 has been established by previous studies. The domain that characterizes epidermal growth factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF- like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor- ligand interactions. Proteins with EGF- like domains often consist of more than 1,000 amino acids, have multiple copies of the EGF- like domain, and contain additional domains known to be involved in specific protein- protein interactions. To identify proteins containing EGF- like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF- like motif. They identified several partial cDNAs encoding novel proteins with EGF- like

domains, such as EGFL2, which they named MEGF3. The predicted partial EGFL2 protein has at least 5 cadherin motifs, 6 EGF- like domains, 2 laminin G domains (see OMIM Ref. No. 601033), 7 transmembrane domains, and a cytoplasmic proline- rich sequence. Human EGFL2 appears to have a domain structure identical to that of rat Megf2 (OMIM Ref. No. 604264), whose complete coding sequence was also isolated by the authors. Northern blot analysis detected rat Megf3 expression in several regions of the brain.

[7822]

[7823] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7824] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201- KIAA0280) deduced by analysis of cDNA clones from cell line KG- 1 and brain. DNA Res. 3: 321- 329, 1996. ; and

[7825] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high- molecular- weight

proteins with multiple EGF- like motifs by motif- trap screening. Genomic.

[7826] Further studies establishing the function and utilities of CELSR2 are found in John Hopkins OMIM database record ID 604265, and in cited publications listed in Table 5, which are hereby incorporated by reference.Centromere protein b, 80kda (CENPB, Accession NP_001801.1) is another GAM63 target gene, herein designated TARGET GENE. CENPB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CENPB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENPB BINDING SITE, designated SEQ ID:16636, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7827] Another function of GAM63 is therefore inhibition of Centromere protein b, 80kda (CENPB, Accession NP_001801.1), a gene which is the major centromere antigen . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPB.

[7828] The function of CENPB has been established by previous

studies. The structure and function of the centromere regions of mitotic chromosomes have been of interest to cell biologists, geneticists and rheumatologists. Cell biologists focus on the centromere as both the site of sister chromatid pairing and the site of mitotic spindle attachment. The latter site, the kinetochore, is a trilaminar plaque structure embedded in the chromatin at the surface of the chromosome, as visualized by electron microscopy. Geneticists have been interested in centromeric sequences involved in the control of chromosomal segregation. Rheumatologists became interested in centromere structure when it was observed that centromere compounds are the target of autoimmune responses. Earnshaw et al. (1987) isolated a series of overlapping DNA clones for about 95% of the mRNA that encodes the B centromeric protein. Anticentromere antibodies recognize 3 antigens: CENPA (17 kD; 117139), CENPB (80 kD), and CENPC (140 kD; 117141). CENPB is considered the major centromere antigen since antibody to it is consistently present at high titer in serum positive for anticentromere antibodies. The B protein is the product of a 2.9- kb mRNA that is encoded by a single locus. By optimizing the primer- annealing temperature in a rapid air cycling pro-

cedure, Sugimoto et al. (1993) specifically amplified human DNA sequences encoding CENPB and CENPC, without any detectable amplification of highly homologous rodent DNA sequences. Using a panel of rodent/human hybrid DNAs, the human CENPB and CENPC genes were mapped to chromosomes 20 and 12, respectively. By fluorescence in situ hybridization, Seki et al. (1994) assigned the CENPB gene to 20p13.

[7829]

[7830] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7831] Earnshaw, W. C.; Sullivan, K. F.; Machlin, P. S.; Cooke, C. A.; Kaiser, D. A.; Pollard, T. D.; Rothfield, N. F.; Cleveland, D. W. : Molecular cloning of cDNA for CENP- B, the major human centromere autoantigen. J. Cell Biol. 104: 817-829, 1987. ; and

[7832] Seki, N.; Saito, T.; Kitagawa, K.; Masumoto, H.; Okazaki, T.; Hori, T.- A. : Mapping of the human centromere protein B gene (CENPB) to chromosome 20p13 by fluorescence in situ hybridizat.

[7833] Further studies establishing the function and utilities of CENPB are found in John Hopkins OMIM database record

ID 117140, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome condensation 1 (CHC1, Accession NP_001260.1) is another GAM63 target gene, herein designated TARGET GENE. CHC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHC1 BINDING SITE, designated SEQ ID:16629, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7834] Another function of GAM63 is therefore inhibition of Chromosome condensation 1 (CHC1, Accession NP_001260.1), a gene which is a regulator of chromosome condensation 1 and therefore may be associated with Crest syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Crest syndrome, and of other diseases and clinical conditions associated with CHC1.

[7835] The function of CHC1 has been established by previous studies. Bischoff et al. (1990) demonstrated that RCC1 protein is homologous to a 47- kD nuclear protein recog-

nized by antikinetochore autoimmune sera from patients with CREST syndrome (OMIM Ref. No. 181750). By hybridization to DNA from sorted chromosomes, Ohtsubo et al. (1987) concluded that the gene, which they symbolized RCC1, is located on chromosome 1. By fluorescence in situ hybridization (FISH) using a suppression FISH method for elimination of repetitive sequences in the genomic clone, Nishimoto et al. (1994) mapped the CHC1 gene to 1p36.1. They reported work of others indicating that the mouse counterpart maps to the distal region of chromosome 4.

[7836]

[7837] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7838] Bischoff, F. R.; Maier, G.; Tilz, G.; Ponstingl, H. : A 47- kDa human nuclear protein recognized by antikinetochore autoimmune sera is homologous with the protein encoded by RCC1, a gene implicated in onset of chromosome condensation. Proc. Nat. Acad. Sci. 87: 8617- 8621, 1990. ; and

[7839] Nemergut, M. E.; Mizzen, C. A.; Stukenberg, T.; Allis, C. D.; Macara, I. G. : Chromatin docking and exchange activ-

ity enhancement of RCC1 by histones H2A and H2B. Science 292: 1540- 1543.

[7840] Further studies establishing the function and utilities of CHC1 are found in John Hopkins OMIM database record ID 179710, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromodomain helicase dna binding protein 4 (CHD4, Accession NP_001264.1) is another GAM63 target gene, herein designated TARGET GENE. CHD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHD4 BINDING SITE, designated SEQ ID:6002, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7841] Another function of GAM63 is therefore inhibition of Chromodomain helicase dna binding protein 4 (CHD4, Accession NP_001264.1), a gene which may regulate gene expression and chromatin structure and therefore may be associated with Dermatomyositis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Dermatomyositis, and of other diseases and clinical con-

ditions associated with CHD4.

[7842] The function of CHD4 has been established by previous studies. Approximately 20% of patients with dermatomyositis develop antibodies against nuclear antigens that are termed Mi2. Sera containing anti- Mi2 antibodies precipitate several proteins, with 1 of the most abundant migrating as a 220- to 260- kD polypeptide on SDS- polyacrylamide gels. By immunoscreening a HeLa cell cDNA expression library with sera from a patient with dermatomyositis, Seelig et al. (1995) isolated a full- length cDNA encoding CHD4, which they called Mi2- beta. Northern blot analysis of Hep- 2 cell RNA detected an approximately 6.8- kb Mi2- beta transcript. The deduced 1,912- amino acid protein has a calculated molecular mass of 218 kD. Native Mi2- beta from Hep- 2 cells has a molecular mass of 235 kD by SDS- PAGE. Searches of sequence databases indicated that Mi2- beta belongs to the SNF2/RAD54 family of nuclear helicases. The central portion of Mi2- beta contains the 7 motifs, including a DEAD/H box, that are characteristic of helicases. Mi2- beta also contains a putative chromatin- binding region and multiple potential nuclear targeting signals, N- glycosylation sites, N- myristoylation sites, and phosphoryla-

tion sites. Immunofluorescence studies localized the Mi2- beta protein to the nucleus. The authors concluded that Mi2- beta is a major antigen recognized by anti- Mi2 sera from patients with dermatomyositis. Studies with sera from dermatomyositis, systemic lupus erythematosus (OMIM Ref. No. 152700), and rheumatoid arthritis (OMIM Ref. No. 180300) patients showed that anti- Mi2- beta antibodies are predominantly found in dermatomyositis patients. Zhang et al. (1998) reported the isolation of a protein complex that contains both histone deacetylation and ATP- dependent nucleosome remodeling activities. The complex contained the histone deacetylases HDAC1/2, histone- binding proteins, the dermatomyositis- specific autoantigen Mi2- beta, a polypeptide related to the metastasis- associated protein- 1, and a novel polypeptide of 32 kD. Patients with dermatomyositis have a high rate of malignancy. The finding that Mi2- beta exists in a complex containing histone deacetylase and nucleosome remodeling activities suggests a role for chromatin reorganization in cancer metastasis.

[7843]

[7844] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[7845] Seelig, H. P.; Moosbrugger, I.; Ehrfeld, H.; Fink, T.; Renz, M.; Genth, E. : The major dermatomyositis- specific Mi- 2 autoantigen is a presumed helicase involved in transcriptional activation. Arthritis Rheum. 38: 1389- 1399, 1995. ; and

[7846] Zhang, Y.; LeRoy, G.; Seelig, H.- P.; Lane, W. S.; Reinberg, D. : The dermatomyositis- specific autoantigen Mi2 is a component of a complex containing histone deacetylase and nucleosome re.

[7847] Further studies establishing the function and utilities of CHD4 are found in John Hopkins OMIM database record ID 603277, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cholinergic receptor, nicotinic, beta polypeptide 2 (neuronal) (CHRNB2, Accession NP_000739.1) is another GAM63 target gene, herein designated TARGET GENE. CHRNB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHRNB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRNB2 BINDING SITE, designated SEQ ID:14758, to the nucleotide se-

quence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7848] Another function of GAM63 is therefore inhibition of Cholinergic receptor, nicotinic, beta polypeptide 2 (neuronal) (CHRNB2, Accession NP_000739.1), a gene which mediates fast signal transmission at synapses. and therefore is associated with Epilepsy, nocturnal frontal lobe, type 3. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Epilepsy, nocturnal frontal lobe, type 3, and of other diseases and clinical conditions associated with CHRNB2.

[7849] The function of CHRNB2 has been established by previous studies. The nicotinic acetylcholine receptors (OMIM Ref. No. nAChRs) are members of a superfamily of ligand-gated ion channels that mediate fast signal transmission at synapses. The nAChRs are thought to be (OMIM Ref. No. hetero)pentamers composed of homologous subunits. See 118508 for additional background information on nAChRs. In affected members of a Scottish family with type 3 nocturnal frontal lobe epilepsy (OMIM Ref. No. 605375), Phillips et al. (2001) identified a G- to- A transition at nucleotide 1025 in the CHRNB2 gene, resulting in a val287- to- met (V287M) substitution within the M2 do-

main. Codon 287 was also involved in the family reported by De Fusco et al. (2000); see 118507.0001. The mutation is located in an evolutionarily conserved region of the gene. Functional receptors with the V287M mutation were highly expressed in Xenopus oocytes and characterized by an approximately 10- fold increase in acetylcholine sensitivity.

[7850] Animal model experiments lend further support to the function of CHRNB2. Picciotto et al. (1995) disrupted the CHRNB2 mouse homolog in embryonic stem (ES) cells to generate 'knockout' mice deficient in this subunit. Homozygous mice were viable, mated normally, and showed no obvious physical deficits. However, their brains showed absence of high- affinity binding sites for nicotine, and electrophysiologic recordings from brain slices showed that thalamic neurons did not respond to nicotine application. Furthermore, behavioral tests demonstrated that nicotine no longer augmented the performance of the deficient mice on passive avoidance, a test of associative memory. Paradoxically, mutant mice were able to perform better than their nonmutant sibs on this task.

[7851] It is appreciated that the abovementioned animal model for CHRNB2 is acknowledged by those skilled in the art as

a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7852] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7853] Phillips, H. A.; Favre, I.; Kirkpatrick, M.; Zuberi, S. M.; Goudie, D.; Heron, S. E.; Scheffer, I. E.; Sutherland, G. R.; Berkovic, S. F.; Bertrand, D.; Mulley, J. C. : CHRNB2 is the second acetylcholine receptor subunit associated with autosomal dominant nocturnal frontal lobe epilepsy. Am. J. Hum. Genet. 68: 225- 231, 2001. ; and

[7854] De Fusco, M.; Becchetti, A.; Patrignani, A.; Annesi, G.; Gambardella, A.; Quattrone, A.; Ballabio, A.; Wanke, E.; Casari, G. : The nicotinic receptor beta- 2 subunit is mutant in nocturn.

[7855] Further studies establishing the function and utilities of CHRNB2 are found in John Hopkins OMIM database record ID 118507, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carbohydrate (keratan sulfate gal-6) sulfotransferase 1 (CHST1, Accession NP_003645.1) is another GAM63 target gene, herein designated TARGET GENE. CHST1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by CHST1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST1 BINDING SITE, designated SEQ ID:19217, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7856] Another function of GAM63 is therefore inhibition of Carbohydrate (keratan sulfate gal-6) sulfotransferase 1 (CHST1, Accession NP_003645.1), a gene which may play a role in keratan sulfate biosynthesis in brain and cornea. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST1.

[7857] The function of CHST1 has been established by previous studies. The keratan sulfate proteoglycans lumican and keratocan are the major proteoglycans in the cornea and are thought to play an important role in corneal transparency. Sulfation appears to be important for the biologic function of keratan sulfate, because undersulfated keratan sulfate is synthesized in patients with macular corneal dystrophy (see OMIM Ref. No. 217800). Keratan sulfate bears sulfate groups on both N- acetylglucosamine (OMIM Ref. No. GlcNAc) and galactose residues. Fukuta et al.

(1997) stated that C6ST (chondroitin 6- sulfotransferase; 603799) catalyzes sulfation of chondroitin and keratan sulfate. However, in developing cornea, keratan sulfate is actively synthesized while chondroitin 6- sulfate synthesis is minimal, suggesting that a different sulfotransferase is present in cornea with specificity towards keratan sulfate. By screening a human fetal brain library with a chick C6ST cDNA, Fukuta et al. (1997) isolated cDNAs encoding C6ST and keratan sulfate gal- 6- sulfotransferase (KSGal6ST). Northern blot analysis revealed that the 2.8- kb KSGal6ST mRNA was expressed in human brain and in chick brain and cornea. A slightly larger and less abundant transcript was observed in human skeletal muscle. The predicted 411- amino acid KSGal6ST shares 37% sequence identity with chick C6ST. When the KSGal6ST cDNA was expressed in COS- 7 cells, keratan sulfate sulfotransferase activity increased, but C6ST activity did not. In vitro, the partially purified KSGal6ST protein showed substrate specificity towards keratan sulfate; KSGal6ST could not utilize chondroitin as an acceptor. Fukuta et al. (1997) concluded that KSGal6ST may participate in the biosynthesis of keratan sulfate in the brain and cornea. Independently, Mazany et al. (1998) cloned genomic DNA and cDNAs corresponding

to CHST1, which they called C6ST. These authors found that stable expression of the CHST1 cDNA in CHO cells increased both C6ST and keratan sulfate sulfotransferase activities. Mazany et al. (1998) suggested that the distinct pattern of CHST1 enzyme activity observed by Fukuta et al. (1997) may be due to differences between the mammalian cell lines used by the 2 groups to express the enzyme.

[7858]

[7859] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7860] Iida, A.; Saito, S.; Sekine, A.; Mishima, C.; Kitamura, Y.; Kondo, K.; Harigae, S.; Osawa, S.; Nakamura, Y. : Catalog of 77 single- nucleotide polymorphisms (SNPs) in the carbohydrate sulfotransferase 1 (CHST1) and carbohydrate sulfotransferase 3 (CHST3) genes. J. Hum. Genet. 47: 14-19, 2002. ; and

[7861] Mazany, K. D.; Peng, T.; Watson, C. E.; Tabas, I.; Williams, K. J. : Human chondroitin 6- sulfotransferase: cloning, gene structure, and chromosomal localization. Biochim. Biophys. Acta.

[7862] Further studies establishing the function and utilities of

CHST1 are found in John Hopkins OMIM database record ID 603797, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine-like factor super family 3 (CKLFSF3, Accession NP_653202.1) is another GAM63 target gene, herein designated TARGET GENE. CKLFSF3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CKLFSF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CKLFSF3 BINDING SITE, designated SEQ ID:19997, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7863] Another function of GAM63 is therefore inhibition of Chemokine-like factor super family 3 (CKLFSF3, Accession NP_653202.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKLFSF3.

[7864] Chemokine-like factor super family 5 (CKLFSF5, Accession NP_612469.1) is another GAM63 target gene, herein designated TARGET GENE. CKLFSF5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA

encoded by CKLFSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CKLFSF5 BINDING SITE, designated SEQ ID:10840, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7865] Another function of GAM63 is therefore inhibition of Chemokine-like factor super family 5 (CKLFSF5, Accession NP_612469.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKLFSF5.

[7866] Creatine kinase, mitochondrial 1 (ubiquitous) (CKMT1, Accession NP_066270.1) is another GAM63 target gene, herein designated TARGET GENE. CKMT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CKMT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CKMT1 BINDING SITE, designated SEQ ID:12177, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7867] Another function of GAM63 is therefore inhibition of Creatine kinase, mitochondrial 1 (ubiquitous) (CKMT1, Accession NP_066270.1), a gene which play a central role in energy transduction in tissues with large, fluctuating energy demands. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKMT1.

[7868] The function of CKMT1 has been established by previous studies. The expression of the 3 cytoplasmic (BB- CK, MB-CK, and MM- CK) and 2 mitochondrial (ubiquitous and sarcomeric) isoforms of creatine kinase (EC 2.7.3.2) is tissue specific and developmentally regulated. At least 4 functionally active genes, which encode the distinct CK subunits CKB (OMIM Ref. No. 123280), CKM (OMIM Ref. No. 123310), CKMT1, and CKMT2 (OMIM Ref. No. 123295), and a number of CKB pseudogenes have been identified. Bark (1980) observed appearance of mitochondrial creatine kinase in the serum of patients with profound shock, which in most of the patients was fatal.

[7869]

[7870] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7871] Bark, C. J. : Mitochondrial creatine kinase: a poor prognostic sign. J.A.M.A. 243: 2058- 2060, 1980. ; and

[7873] Further studies establishing the function and utilities of CKMT1 are found in John Hopkins OMIM database record ID 123290, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chloride channel 6 (CLCN6, Accession NP_068505.1) is another GAM63 target gene, herein designated TARGET GENE. CLCN6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLCN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE, designated SEQ ID:1912, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7874] Another function of GAM63 is therefore inhibition of Chloride channel 6 (CLCN6, Accession NP_068505.1), a gene which is a voltage- gated chloride channel. Accord-

ingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6.

[7875] The function of CLCN6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Chloride channel 6 (CLCN6, Accession NP_068504.1) is another GAM63 target gene, herein designated TARGET GENE. CLCN6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLCN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE, designated SEQ ID:1912, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7876] Another function of GAM63 is therefore inhibition of Chloride channel 6 (CLCN6, Accession NP_068504.1), a gene which is a voltage- gated chloride channel. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6.

[7877] The function of CLCN6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Chloride channel 6 (CLCN6, Accession NP_068503.1) is another GAM63 target gene, herein designated TARGET GENE. CLCN6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLCN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE, designated SEQ ID:1912, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7878] Another function of GAM63 is therefore inhibition of Chloride channel 6 (CLCN6, Accession NP_068503.1), a gene which is a voltage- gated chloride channel. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6.

[7879] The function of CLCN6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM40.1.Chloride channel 6 (CLCN6, Accession NP_001277.1) is another GAM63 target gene, herein designated TARGET GENE. CLCN6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLCN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE, designated SEQ ID:1912, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7880] Another function of GAM63 is therefore inhibition of Chloride channel 6 (CLCN6, Accession NP_001277.1), a gene which is a voltage- gated chloride channel. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6.

[7881] The function of CLCN6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Claudin 15 (CLDN15, Accession NP_055158.1) is another GAM63 target gene, herein designated TARGET GENE. CLDN15 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLDN15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLDN15 BINDING SITE, designated SEQ ID:13079, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7882] Another function of GAM63 is therefore inhibition of Claudin 15 (CLDN15, Accession NP_055158.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN15.

[7883] CLL-1 (Accession NP_612210.1) is another GAM63 target gene, herein designated TARGET GENE. CLL-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLL-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLL-1 BINDING SITE, designated SEQ ID:1380, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7884] Another function of GAM63 is therefore inhibition of CLL-1 (Accession NP_612210.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLL-1.

[7885] Collagen, type i, alpha 2 (COL1A2, Accession NP_000080.1) is another GAM63 target gene, herein designated TARGET GENE. COL1A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL1A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL1A2 BINDING SITE, designated SEQ ID:5175, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7886] Another function of GAM63 is therefore inhibition of Collagen, type i, alpha 2 (COL1A2, Accession NP_000080.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A2.

[7887] Collagen, type ix, alpha 2 (COL9A2, Accession NP_001843.1) is another GAM63 target gene, herein designated TARGET GENE. COL9A2 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by COL9A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL9A2 BINDING SITE, designated SEQ ID:13362, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7888] Another function of GAM63 is therefore inhibition of Collagen, type ix, alpha 2 (COL9A2, Accession NP_001843.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL9A2.

[7889] Carboxypeptidase a5 (CPA5, Accession NP_525124.2) is another GAM63 target gene, herein designated TARGET GENE. CPA5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPA5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPA5 BINDING SITE, designated SEQ ID:5792, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7890] Another function of GAM63 is therefore inhibition of Carboxypeptidase a5 (CPA5, Accession NP_525124.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPA5.

[7891] cPLA2delta (Accession NP_828848.1) is another GAM63 target gene, herein designated TARGET GENE. cPLA2delta BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by cPLA2delta, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of cPLA2delta BINDING SITE, designated SEQ ID:10856, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7892] Another function of GAM63 is therefore inhibition of cPLA2delta (Accession NP_828848.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with cPLA2delta.

[7893] cPLA2delta (Accession XP_208820.2) is another GAM63 target gene, herein designated TARGET GENE. cPLA2delta

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by cPLA2delta, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of cPLA2delta BINDING SITE, designated SEQ ID:10856, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7894] Another function of GAM63 is therefore inhibition of cPLA2delta (Accession XP_208820.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with cPLA2delta.

[7895] Complexin 2 (CPLX2, Accession NP_006641.1) is another GAM63 target gene, herein designated TARGET GENE. CPLX2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CPLX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPLX2 BINDING SITE, designated SEQ ID:6535, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[7896] Another function of GAM63 is therefore inhibition of Complexin 2 (CPLX2, Accession NP_006641.1), a gene which functions in synaptic vesicle exocytosis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX2.

[7897] The function of CPLX2 has been established by previous studies. Reim et al. (2001) created deletion mutations in the murine Cplx1 and Cplx2 genes and homozygous single and double mutants with their respective controls. They found that mice lacking Cplx2 showed no obvious phenotypic changes. In contrast, homozygous Cplx1 deletion mutants developed a strong ataxia, suffered from sporadic seizures, were unable to reproduce, and died within 2 to 4 months after birth. Although loss of Cplx1 was ultimately fatal, the fact that mice lacking either Cplx1 or Cplx2 lived for at least 2 months after birth indicated that Cplx1 and Cplx2 are partially redundant. They therefore generated double mutants lacking both Cplx isoforms. Homozygous Cplx1/2 double mutants died within a few hours after birth. In order to detect possible developmental changes or alterations in brain structure

due to Cplx deletion mutations, they analyzed morphologic characteristics of brains from homozygous adult Cplx1 and Cplx2 single mutants as well as newborn Cplx1/2 double mutants. They demonstrated that complexins are important regulators of transmitter release at a step immediately preceding vesicle fusion. Neurons lacking complexins showed a dramatically reduced transmitter release efficiency due to decreased calcium sensitivity of the synaptic secretion process. Analyses of mutant neurons demonstrated that complexins are acting at or following the calcium- triggering step of fast synchronous transmitter release by regulating the exocytotic calcium sensor, its interaction with the core complex fusion machinery, or the efficiency of the fusion apparatus itself Complexins, also called synaphins, are cytosolic proteins that preferentially bind to syntaxin within the SNARE complex. Studying squid and rat synaphin, Tokumaru et al. (2001) found that synaphin promotes SNAREs to form precomplexes that oligomerize into higher- order structures. A peptide from the central, syntaxin- binding domain of synaphin competitively inhibited these 2 proteins from interacting and prevented SNARE complexes from oligomerizing. Injection of this peptide into squid

giant presynaptic terminals inhibited neurotransmitter release at a late prefusion step of synaptic vesicle exocytosis. The authors proposed that oligomerization of SNARE complexes into a higher- order structure creates a SNARE scaffold for efficient, regulated fusion of synaptic vesicles.

[7898]

[7899] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7900] Reim, K.; Mansour, M.; Varoqueaux, F.; McMahon, H. T.; Sudhof, T. C.; Brose, N.; Rosenmund, C. : Complexins regulate a late step in Ca(2+)- dependent neurotransmitter release. Cell 104: 71- 81, 2001. ; and

[7901] Tokumaru, H.; Umayahara, K.; Pellegrini, L. L.; Ishizuka, T.; Saisu, H.; Betz, H.; Augustine, G. J.; Abe, T. : SNARE complex oligomerization by synaphin/complexin is essential for synap.

[7902] Further studies establishing the function and utilities of CPLX2 are found in John Hopkins OMIM database record ID 605033, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cullin 3 (CUL3, Accession NP_003581.1) is another GAM63 target gene, herein designated TARGET GENE. CUL3 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CUL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:7916, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7903] Another function of GAM63 is therefore inhibition of Cullin 3 (CUL3, Accession NP_003581.1), a gene which may target other proteins for ubiquitin- dependent proteolysis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3.

[7904] The function of CUL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM32.1.Chemokine (c-x-c motif) ligand 12 (stromal cell-derived factor 1) (CXCL12, Accession NP_000600.1) is another GAM63 target gene, herein designated TARGET GENE. CXCL12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCL12, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL12 BINDING SITE, designated SEQ ID:785, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7905] Another function of GAM63 is therefore inhibition of Chemokine (c-x-c motif) ligand 12 (stromal cell-derived factor 1) (CXCL12, Accession NP_000600.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL12.

[7906] Cytochrome p450, subfamily xxviib (25-hydroxyvitamin d-1-alpha-hydroxylase), polypeptide 1 (CYP27B1, Accession NP_000776.1) is another GAM63 target gene, herein designated TARGET GENE. CYP27B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP27B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP27B1 BINDING SITE, designated SEQ ID:18862, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7907] Another function of GAM63 is therefore inhibition of Cytochrome p450, subfamily xxviib (25-hydroxyvitamin d-1-alpha-hydroxylase), polypeptide 1 (CYP27B1, Accession NP_000776.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP27B1.

[7908] D21S2056E (Accession NP_003674.1) is another GAM63 target gene, herein designated TARGET GENE. D21S2056E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by D21S2056E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of D21S2056E BINDING SITE, designated SEQ ID:6022, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7909] Another function of GAM63 is therefore inhibition of D21S2056E (Accession NP_003674.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D21S2056E.

[7910] Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NP_004384.1) is another GAM63 target

gene, herein designated TARGET GENE. DAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:15198, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7911] Another function of GAM63 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NP_004384.1), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM) and therefore may be associated with Fukuyama-type congenital muscular dystrophy. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Fukuyama- type congenital muscular dystrophy., and of other diseases and clinical conditions associated with DAG1.

[7912] The function of DAG1 has been established by previous studies. Ibraghimov- Beskrovnaya et al. (1992) demonstrated that the transmembrane 43- kD and extracellular 156- kD dystrophin (OMIM Ref. No. 300377)- associated

glycoproteins are encoded by a single messenger RNA and that the extracellular 156- kD DAG binds laminin. Thus, the 156- kD DAG is a laminin- binding glycoprotein that may provide linkage between the sarcolemma and extracellular matrix (ECM). The dramatic reduction in the 156K DAG in Duchenne muscular dystrophy (OMIM Ref. No. 310200) led to a loss of linkage between the sarcolemma and extracellular matrix, rendering muscle fibers more susceptible to necrosis. Ibraghimov- Beskrovnaya et al. (1992, 1992, 1993) mapped the DAG gene to chromosome 3 by Southern blot analysis of human/Chinese hamster somatic cell hybrid DNAs. One hybrid cell line with an isochromosome 3q was negative, suggesting location of the gene on 3p. The regional assignment was confirmed and further refined by fluorescence in situ hybridization, the localization being 3p21. The coding sequence of the DAG1 gene is organized into 2 exons, separated by a large intron (Ibraghimov- Beskrovnaya et al., 1993). The predicted amino acid sequence of human and rabbit dystroglycan are 93% identical, with predicted glycosylation sites being conserved. Human dystroglycan is expressed in a variety of fetal and adult tissues. The muscle and nonmuscle isoforms of dystroglycan differ by carbohy-

drate moieties but not protein sequence. Using PCR, immunohistochemistry, and immunoblotting to analyze samples from patients with Fukuyama congenital muscular dystrophy (FCMD; 253800), Hayashi et al. (2001) confirmed a deficiency of fukutin and found marked deficiency of highly glycosylated DAG1 in skeletal and cardiac muscle and reduced amounts of DAG1 in brain tissue. Beta- dystroglycan was normal in all tissues examined. These findings supported the suggestion that fukutin deficiency affects the modification of glycosylation of DAG1, which then cannot localize or function properly and may be degraded or eluted from the extracellular surface membrane of the muscle fiber. Hayashi et al. (2001) concluded that this disruption underlies the developmental, structural, and functional damage to muscles in patients with FCMD.

[7913] Animal model experiments lend further support to the function of DAG1. Cohn et al. (2002) found that striated muscle- specific disruption of the Dag1 gene in mice resulted in loss of the dystrophin- glycoprotein complex in differentiated muscle and a remarkably mild muscular dystrophy with hypertrophy and without tissue fibrosis. They found that satellite cells, expressing dystroglycan,

supported continued efficient regeneration of skeletal muscle along with transient expression of dystroglycan in regenerating muscle fibers. Cohn et al. (2002) demonstrated a similar phenomenon of reexpression of functional dystroglycan in regenerating muscle fibers in a mild form of human muscular dystrophy caused by disruption of posttranslational dystroglycan processing. They concluded that maintenance of regenerative capacity by satellite cells expressing dystroglycan is likely responsible for mild disease progression in mice and possibly humans. Cohn et al. (2002) suggested that inadequate repair of skeletal muscle by satellite cells represents an important mechanism affecting the pathogenesis of muscular dystrophy.

[7914] It is appreciated that the abovementioned animal model for DAG1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7915] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7916] Ibraghimov- Beskrovnaya, O.; Ervasti, J. M.; Leveille, C. J.; Slaughter, C. A.; Sernett, S. W.; Campbell, K. P. : Primary

structure of dystrophin- associated glycoproteins linking dystrophin to the extracellular matrix. Nature 355: 696-702, 1992. ; and

[7917] Hayashi, Y. K.; Ogawa, M.; Tagawa, K.; Noguchi, S.; Ishihara, T.; Nonaka, I.; Arahata, K. : Selective deficiency of alpha- dystroglycan in Fukuyama- type congenital muscular dystrophy. N.

[7918] Further studies establishing the function and utilities of DAG1 are found in John Hopkins OMIM database record ID 128239, and in cited publications listed in Table 5, which are hereby incorporated by reference.Daz associated protein 2 (DAZAP2, Accession NP_055579.1) is another GAM63 target gene, herein designated TARGET GENE. DAZAP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAZAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAZAP2 BINDING SITE, designated SEQ ID:757, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7919] Another function of GAM63 is therefore inhibition of Daz associated protein 2 (DAZAP2, Accession NP_055579.1) .

Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZAP2.

[7920] Dead/h (asp-glu-ala-asp/his) box polypeptide 11 (chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_085911.1) is another GAM63 target gene, herein designated TARGET GENE. DDX11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DDX11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE, designated SEQ ID:5910, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7921] Another function of GAM63 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 11 (chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_085911.1), a gene which could be an ATP- dependent DNA- binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11.

[7922] The function of DDX11 has been established by previous studies. Helicases are essential components of a number of multiprotein complexes, including those that regulate transcription, splicing, translation, and DNA repair. These enzymes assist in the unwinding of double- stranded DNA and RNA as an essential part of their function. DEAD box proteins are putative RNA helicases that have a characteristic Asp- Glu- Ala- Asp (DEAD) box as 1 of 8 highly conserved sequence motifs. See 600396. The yeast Chl1 gene encodes a putative helicase that appears to be essential for normal chromosome transmission. Amann et al. (1996) studied 2 human genes related to the Chl1 gene of Saccharomyces cerevisiae: CHLR1 and CHLR2 (OMIM Ref. No. 601151). The open reading frames (ORFs) of these genes encode proteins with a predicted molecular weight of 102 kD, and the in vitro transcribed and translated products bind efficiently to single- stranded DNA. The predicted ORFs of these 2 genes are more than 98% identical, suggesting that they may have redundant functions. The genes were localized to 12p11 and 12p13 by analysis of somatic cell hybrids and fluorescence in situ hybridization. Fluorescence in situ hybridization indicated that the 2 CHLR gene loci are physically distinct and separated by

8 to 12 Mb. Others had reported the duplication of this region of 12p involving a human expressed sequence tag (EST) and 2 previously uncharacterized cDNAs, which Amann et al. (1996) showed were, in fact, the CHLR genes. A comparison of the CHLR gene sequences with available databases indicated that a large proportion of these genes, including exons encoding 2 functional domains of the carboxyl- terminal region, had been duplicated as part of a large human telomeric repeat sequence found on many human chromosomes. The results suggested to the authors that duplication of a relatively large region of chromosome 12p containing this putative helicase gene has resulted in the creation of numerous pseudogenes as part of a subtelomeric repeat. Amann et al. (1996) stated that the presence of these helicase pseudogenes, as well as pseudogenes for other genes such as the interleukin- 9 receptor (OMIM Ref. No. 300007), within many subtelomeric regions supported the possibility that the spread of this region is subject to exchange between different chromosomes and may have implications for elucidation of the mechanism of intra- and interchromosomal duplication events. Frank and Werner (1996) used differential display PCR to identify novel cDNAs in keratinocytes whose ex-

pression is regulated by keratinocyte growth factor (KGF; 148180). One such clone, termed KRG2 by the authors, was identified, and a full- length cDNA was cloned from a KGF- stimulated keratinocyte cDNA library. Southern blot analysis suggested that KRG2 is a member of a multigene family. Northern blot analysis revealed a single 4.3- kb mRNA whose expression is upregulated by KGF. The authors used RNase protection assays to determine that serum, EGF, and cytokine IL- 1- beta (OMIM Ref. No. 147720) had no effect on KRG2 expression, while inhibitors of keratinocyte proliferation, such as TGF- beta-1 (OMIM Ref. No. 190180) and TNF- alpha (OMIM Ref. No. 191160), caused a slight reduction in KRG2 expression. Sequence analysis indicated that the KRG2 cDNA encodes an 856- amino acid protein that is 32% identical to the yeast gene CHL1. Frank and Werner (1996) hypothesized that KRG2 may be involved in cell cycle regulation.

[7923]

[7924] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7925] Amann, J.; Kidd, V. J.; Lahti, J. M. : Characterization of putative human homologues of the yeast chromosome

transmission fidelity gene, CHL1. J. Biol. Chem. 272: 3823- 3832, 1997. ; and

[7926] Frank, S.; Werner, S. : The human homologue of the yeast CHL1 gene is a novel keratinocyte growth factor- regulated gene. J. Biol. Chem. 271: 24337- 24340, 1996.

[7927] Further studies establishing the function and utilities of DDX11 are found in John Hopkins OMIM database record ID 601150, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dead/h (asp-glu-ala-asp/his) box polypeptide 11 (chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_004390.2) is another GAM63 target gene, herein designated TARGET GENE. DDX11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DDX11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE, designated SEQ ID:5910, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7928] Another function of GAM63 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 11

(chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_004390.2), a gene which could be an ATP- dependent DNA- binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11.

[7929] The function of DDX11 has been established by previous studies. Helicases are essential components of a number of multiprotein complexes, including those that regulate transcription, splicing, translation, and DNA repair. These enzymes assist in the unwinding of double- stranded DNA and RNA as an essential part of their function. DEAD box proteins are putative RNA helicases that have a characteristic Asp- Glu- Ala- Asp (DEAD) box as 1 of 8 highly conserved sequence motifs. See 600396. [7939] Amann, J.; Kidd, V. J.; Lahti, J. M. : Characterization of putative human homologues of the yeast chromosome transmission fidelity gene, CHL1. J. Biol. Chem. 272: 3823- 3832, 1997. ; and

[7940] Frank, S.; Werner, S. : The human homologue of the yeast CHL1 gene is a novel keratinocyte growth factor- regulated gene. J. Biol. Chem. 271: 24337- 24340, 1996.

[7941] Further studies establishing the function and utilities of DDX11 are found in John Hopkins OMIM database record ID 601150, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dead/h (asp-glu-ala-asp/his) box polypeptide 34 (DDX34, Accession NP_055496.1) is another GAM63 target gene, herein

designated TARGET GENE. DDX34 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DDX34, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:1581, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7942] Another function of GAM63 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 34 (DDX34, Accession NP_055496.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34.

[7943] Defensin, beta 127 (DEFB127, Accession NP_620713.1) is another GAM63 target gene, herein designated TARGET GENE. DEFB127 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DEFB127, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DEFB127 BINDING SITE, designated SEQ ID:11155, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7944] Another function of GAM63 is therefore inhibition of Defensin, beta 127 (DEFB127, Accession NP_620713.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEFB127.

[7945] Digeorge syndrome critical region gene 6 (DGCR6, Accession NP_005666.2) is another GAM63 target gene, herein designated TARGET GENE. DGCR6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DGCR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DGCR6 BINDING SITE, designated SEQ ID:4437, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7946] Another function of GAM63 is therefore inhibition of Digeorge syndrome critical region gene 6 (DGCR6, Accession NP_005666.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR6.

[7947] Digeorge syndrome critical region gene 6-like (DGCR6L, Accession NP_150282.1) is another GAM63 target gene, herein designated TARGET GENE. DGCR6L BINDING SITE is

a target binding site found in the 3` untranslated region of mRNA encoded by DGCR6L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DGCR6L BINDING SITE, designated SEQ ID:4437, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7948] Another function of GAM63 is therefore inhibition of Digeorge syndrome critical region gene 6-like (DGCR6L, Accession NP_150282.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR6L.

[7949] DISPB (Accession NP_277045.1) is another GAM63 target gene, herein designated TARGET GENE. DISPB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DISPB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DISPB BINDING SITE, designated SEQ ID:17539, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7950] Another function of GAM63 is therefore inhibition of DISPB (Accession NP_277045.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISPB.

[7951] DKFZP434D193 (Accession XP_114297.2) is another GAM63 target gene, herein designated TARGET GENE. DKFZP434D193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434D193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434D193 BINDING SITE, designated SEQ ID:9123, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7952] Another function of GAM63 is therefore inhibition of DKFZP434D193 (Accession XP_114297.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D193.

[7953] DKFZP434F122 (Accession NP_056458.1) is another GAM63 target gene, herein designated TARGET GENE. DKFZP434F122 BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by DKFZP434F122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434F122 BINDING SITE, designated SEQ ID:15958, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7954] Another function of GAM63 is therefore inhibition of DKFZP434F122 (Accession NP_056458.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F122.

[7955] DKFZp434F142 (Accession NP_115630.1) is another GAM63 target gene, herein designated TARGET GENE. DKFZp434F142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434F142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:18569, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated

SEQ ID:348.

[7956] Another function of GAM63 is therefore inhibition of DKFZp434F142 (Accession NP_115630.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F142.

[7957] DKFZp434H055 (Accession XP_064865.3) is another GAM63 target gene, herein designated TARGET GENE. DKFZp434H055 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434H055, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434H055 BINDING SITE, designated SEQ ID:15511, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7958] Another function of GAM63 is therefore inhibition of DKFZp434H055 (Accession XP_064865.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434H055.

[7959] DKFZp434M1411 (Accession XP_088463.5) is another

GAM63 target gene, herein designated TARGET GENE. DK-FZp434M1411 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DK-FZp434M1411, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434M1411 BINDING SITE, designated SEQ ID:18924, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7960] Another function of GAM63 is therefore inhibition of DK-FZp434M1411 (Accession XP_088463.5) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434M1411.

[7961] DKFZP434P0111 (Accession XP_041116.1) is another GAM63 target gene, herein designated TARGET GENE. DK-FZP434P0111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZP434P0111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, des-

ignated SEQ ID:12595, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7962] Another function of GAM63 is therefore inhibition of DKFZP434P0111 (Accession XP_041116.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111.

[7963] DKFZP564J0123 (Accession XP_300857.1) is another GAM63 target gene, herein designated TARGET GENE. DKFZP564J0123 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564J0123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564J0123 BINDING SITE, designated SEQ ID:2440, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7964] Another function of GAM63 is therefore inhibition of DKFZP564J0123 (Accession XP_300857.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DKFZP564J0123.

[7965] DKFZP566K1924 (Accession NP_056278.1) is another GAM63 target gene, herein designated TARGET GENE. DKFZP566K1924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:20108, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7966] Another function of GAM63 is therefore inhibition of DKFZP566K1924 (Accession NP_056278.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924.

[7967] DKFZp667M2411 (Accession XP_290795.1) is another GAM63 target gene, herein designated TARGET GENE. DKFZp667M2411 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp667M2411, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667M2411 BINDING SITE, designated SEQ ID:19396, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7968] Another function of GAM63 is therefore inhibition of DKFZp667M2411 (Accession XP_290795.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667M2411.

[7969] DKFZp761B107 (Accession NP_775734.1) is another GAM63 target gene, herein designated TARGET GENE. DKFZp761B107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761B107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B107 BINDING SITE, designated SEQ ID:8017, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7970] Another function of GAM63 is therefore inhibition of DKFZp761B107 (Accession NP_775734.1) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B107.

[7971] DKFZp761L1417 (Accession NP_690877.1) is another GAM63 target gene, herein designated TARGET GENE. DKFZp761L1417 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761L1417, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761L1417 BINDING SITE, designated SEQ ID:2815, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7972] Another function of GAM63 is therefore inhibition of DKFZp761L1417 (Accession NP_690877.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761L1417.

[7973] DPCR1 (Accession NP_543146.1) is another GAM63 target gene, herein designated TARGET GENE. DPCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DPCR1, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPCR1 BINDING SITE, designated SEQ ID:6228, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7974] Another function of GAM63 is therefore inhibition of DPCR1 (Accession NP_543146.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPCR1.

[7975] DPF3 (Accession NP_036206.1) is another GAM63 target gene, herein designated TARGET GENE. DPF3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DPF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPF3 BINDING SITE, designated SEQ ID:1393, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7976] Another function of GAM63 is therefore inhibition of DPF3 (Accession NP_036206.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with DPF3.

[7977] Dishevelled, dsh homolog 3 (drosophila) (DVL3, Accession NP_004414.2) is another GAM63 target gene, herein designated TARGET GENE. DVL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DVL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:19305, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7978] Another function of GAM63 is therefore inhibition of Dishevelled, dsh homolog 3 (drosophila) (DVL3, Accession NP_004414.2), a gene which regulates cell proliferation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3.

[7979] The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NP_567824.1) is another GAM63 target gene, herein designated TARGET

GENE. DYRK1A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DYRK1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:9660, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7980] Another function of GAM63 is therefore inhibition of Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NP_567824.1), a gene which regulates cell proliferation and may be involved in brain development . and therefore may be associated with Down syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Down syndrome, and of other diseases and clinical conditions associated with DYRK1A.

[7981] The function of DYRK1A has been established by previous studies. Shindoh et al. (1996) performed exon trapping to find exons within YAC clones spanning the 2- Mb 'Down syndrome critical region' (OMIM Ref. No. 190685) of human chromosome 21. Of more than 160 exons isolated,

they found 6 that had significant identity at the amino acid level to the Drosophila 'minibrain' gene. Using 1 of these exons as a probe, they cloned the full- length human cDNA from a human fetal brain cDNA library. Sequence analysis of this cDNA revealed an open reading frame encoding a polypeptide of 754 amino acids. Shindoh et al. (1996) stated that this gene, termed MNB by them, represents the human homolog of the Drosophila mnb gene and of the rat Dyrk gene. The rat Dyrk gene differs from it by only 4 amino acids. Northern blot analysis of MNB revealed 2 transcripts of 6.0 and 7.5 kb. The 6.0- kb transcript was found to be present in all tissues examined, with highest levels of expression in skeletal muscle, testis, fetal lung, and fetal kidney. The 7.5- kb transcript was found to be expressed at a relatively lower level and was found only in adult heart, placenta, spleen, and testis. Shindoh et al. (1996) concluded that the human MNB protein may play a significant role in a signaling pathway regulating cell proliferation and may be involved in normal brain development and in the pathogenesis of Down syndrome.

[7982] Animal model experiments lend further support to the function of DYRK1A. Using Down syndrome as a model for

complex trait analysis, Smith et al. (1997) sought to identify loci from 21q22.2 which, when present in an extra dose, contribute to learning abnormalities. They generated low- copy number transgenic mice, containing 4 different YACs that together cover approximately 2 Mb of contiguous DNA from 21q22.2. They subjected independent mouse lines derived from each of these YAC transgenes to a series of behavioral and learning assays. Two of the 4 YACs caused defects in learning and memory in the transgenic animals, while the other 2 YACs had no effect. The most severe defects were caused by a 570- kb YAC; the interval responsible for these defects was narrowed to a 180- kb critical region as a consequence of YAC fragmentation. This region was found to contain the human homolog of the Drosophila 'minibrain' gene, and strongly implicated it in learning defects associated with Down syndrome.

[7983] It is appreciated that the abovementioned animal model for DYRK1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7984] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[7985] Shindoh, N.; Kudoh, J.; Maeda, H.; Yamaki, A.; Minoshima, S.; Shimizu, Y.; Shimizu, N. : Cloning of a human homolog of the Drosophila minibrain/rat Dyrk gene from 'the Down syndrome critical region' of chromosome 21. Biochem. Biophys. Res. Commun. 225: 92- 99, 1996. ; and

[7987] Further studies establishing the function and utilities of DYRK1A are found in John Hopkins OMIM database record ID 600855, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NP_569122.1) is another GAM63 target gene, herein designated TARGET GENE. DYRK1A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DYRK1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYRK1A BIND-

ING SITE, designated SEQ ID:9660, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7988] Another function of GAM63 is therefore inhibition of Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NP_569122.1), a gene which regulates cell proliferation and may be involved in brain development . and therefore may be associated with Down syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Down syndrome, and of other diseases and clinical conditions associated with DYRK1A.

[7989] The function of DYRK1A has been established by previous studies. Shindoh et al. (1996) performed exon trapping to find exons within YAC clones spanning the 2- Mb 'Down syndrome critical region' (OMIM Ref. No. 190685) of human chromosome 21. Of more than 160 exons isolated, they found 6 that had significant identity at the amino acid level to the Drosophila 'minibrain' gene. Using 1 of these exons as a probe, they cloned the full- length human cDNA from a human fetal brain cDNA library. Sequence analysis of this cDNA revealed an open reading frame encoding a polypeptide of 754 amino acids. Shin-

doh et al. (1996) stated that this gene, termed MNB by them, represents the human homolog of the Drosophila mnb gene and of the rat Dyrk gene. The rat Dyrk gene differs from it by only 4 amino acids. Northern blot analysis of MNB revealed 2 transcripts of 6.0 and 7.5 kb. The 6.0- kb transcript was found to be present in all tissues examined, with highest levels of expression in skeletal muscle, testis, fetal lung, and fetal kidney. The 7.5- kb transcript was found to be expressed at a relatively lower level and was found only in adult heart, placenta, spleen, and testis. Shindoh et al. (1996) concluded that the human MNB protein may play a significant role in a signaling pathway regulating cell proliferation and may be involved in normal brain development and in the pathogenesis of Down syndrome.

[7990] Animal model experiments lend further support to the function of DYRK1A. Using Down syndrome as a model for complex trait analysis, Smith et al. (1997) sought to identify loci from 21q22.2 which, when present in an extra dose, contribute to learning abnormalities. They generated low- copy number transgenic mice, containing 4 different YACs that together cover approximately 2 Mb of contiguous DNA from 21q22.2. They subjected indepen-

dent mouse lines derived from each of these YAC transgenes to a series of behavioral and learning assays. Two of the 4 YACs caused defects in learning and memory in the transgenic animals, while the other 2 YACs had no effect. The most severe defects were caused by a 570- kb YAC; the interval responsible for these defects was narrowed to a 180- kb critical region as a consequence of YAC fragmentation. This region was found to contain the human homolog of the Drosophila 'minibrain' gene, and strongly implicated it in learning defects associated with Down syndrome.

[7991] It is appreciated that the abovementioned animal model for DYRK1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7993] Shindoh, N.; Kudoh, J.; Maeda, H.; Yamaki, A.; Minoshima, S.; Shimizu, Y.; Shimizu, N. : Cloning of a human homolog of the Drosophila minibrain/rat Dyrk gene from 'the Down syndrome critical region' of chromosome 21. Biochem. Biophys. Res. Commun. 225: 92- 99, 1996. ; and

[7994] Smith, D. J.; Stevens, M. E.; Sudanagunta, S. P.; Bronson, R. T.; Makhinson, M.; Watabe, A. M.; O'Dell, T. J.; Fung, J.; Weier, H.- U. G.; Cheng, J.- F.; Rubin, E. M. : Functional screeni.

[7995] Further studies establishing the function and utilities of DYRK1A are found in John Hopkins OMIM database record ID 600855, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NP_569121.1) is another GAM63 target gene, herein designated TARGET GENE. DYRK1A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DYRK1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:9660, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[7996] Another function of GAM63 is therefore inhibition of Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1a (DYRK1A, Accession NP_569121.1), a gene

which regulates cell proliferation and may be involved in brain development . and therefore may be associated with Down syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Down syndrome, and of other diseases and clinical conditions associated with DYRK1A.

[7997] The function of DYRK1A has been established by previous studies. Shindoh et al. (1996) performed exon trapping to find exons within YAC clones spanning the 2- Mb 'Down syndrome critical region' (OMIM Ref. No. 190685) of human chromosome 21. Of more than 160 exons isolated, they found 6 that had significant identity at the amino acid level to the Drosophila 'minibrain' gene. Using 1 of these exons as a probe, they cloned the full- length human cDNA from a human fetal brain cDNA library. Sequence analysis of this cDNA revealed an open reading frame encoding a polypeptide of 754 amino acids. Shindoh et al. (1996) stated that this gene, termed MNB by them, represents the human homolog of the Drosophila mnb gene and of the rat Dyrk gene. The rat Dyrk gene differs from it by only 4 amino acids. Northern blot analysis of MNB revealed 2 transcripts of 6.0 and 7.5 kb. The 6.0- kb transcript was found to be present in all tissues

examined, with highest levels of expression in skeletal muscle, testis, fetal lung, and fetal kidney. The 7.5- kb transcript was found to be expressed at a relatively lower level and was found only in adult heart, placenta, spleen, and testis. Shindoh et al. (1996) concluded that the human MNB protein may play a significant role in a signaling pathway regulating cell proliferation and may be involved in normal brain development and in the pathogenesis of Down syndrome.

[7998] Animal model experiments lend further support to the function of DYRK1A. Using Down syndrome as a model for complex trait analysis, Smith et al. (1997) sought to identify loci from 21q22.2 which, when present in an extra dose, contribute to learning abnormalities. They generated low- copy number transgenic mice, containing 4 different YACs that together cover approximately 2 Mb of contiguous DNA from 21q22.2. They subjected independent mouse lines derived from each of these YAC transgenes to a series of behavioral and learning assays. Two of the 4 YACs caused defects in learning and memory in the transgenic animals, while the other 2 YACs had no effect. The most severe defects were caused by a 570- kb YAC; the interval responsible for these defects was nar-

rowed to a 180- kb critical region as a consequence of YAC fragmentation. This region was found to contain the human homolog of the Drosophila 'minibrain' gene, and strongly implicated it in learning defects associated with Down syndrome.

[7999] It is appreciated that the abovementioned animal model for DYRK1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8000] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8001] Shindoh, N.; Kudoh, J.; Maeda, H.; Yamaki, A.; Minoshima, S.; Shimizu, Y.; Shimizu, N. : Cloning of a human homolog of the Drosophila minibrain/rat Dyrk gene from 'the Down syndrome critical region' of chromosome 21. Biochem. Biophys. Res. Commun. 225: 92- 99, 1996. ; and

[8002] Smith, D. J.; Stevens, M. E.; Sudanagunta, S. P.; Bronson, R. T.; Makhinson, M.; Watabe, A. M.; O'Dell, T. J.; Fung, J.; Weier, H.- U. G.; Cheng, J.- F.; Rubin, E. M. : Functional screeni.

[8003] Further studies establishing the function and utilities of DYRK1A are found in John Hopkins OMIM database record

ID 600855, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1b (DYRK1B, Accession NP_004705.1) is another GAM63 target gene, herein designated TARGET GENE. DYRK1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DYRK1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYRK1B BINDING SITE, designated SEQ ID:3553, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8004] Another function of GAM63 is therefore inhibition of Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1b (DYRK1B, Accession NP_004705.1), a gene which is a mitogen- activated dual- specificity protein kinase substrate and therefore may be associated with Colon cancer. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Colon cancer, and of other diseases and clinical conditions associated with DYRK1B.

[8005] The function of DYRK1B has been established by previous studies. The DYRK1A gene (OMIM Ref. No. 600855), located on human chromosome 21 and encoding a dual-specificity protein kinase, is the human homolog of the Drosophila 'minibrain' gene. The minibrain protein product, mnb, is involved in postembryonic neurogenesis. By performing RACE on human testis RNA using primers designed to the catalytic domain of DYRK1A, Leder et al. (1999) isolated a partial DYRK1B cDNA; they obtained the complete coding sequence of human DYRK1B by PCR cloning from human testis cDNA. The putative DYRK1B peptide has a domain structure similar to that of DYRK1A, with a kinase domain flanked by a 110- amino acid N-terminal domain and a 198- amino acid C- terminal domain. Human DYRK1A and DYRK1B proteins are 84% identical in the N- terminal and catalytic domains but show no extended similarity in the C- terminal region. Northern blot analysis detected a 2.4- kb DYRK1B transcript in testis and skeletal muscle. Expression of DYRK1B as a GFP fusion protein in COS- 7 cells localized the protein to the nucleus. Human and mouse DYRK1B proteins share 97% sequence identity. Lee et al. (2000) cloned the same gene, which they designated MIRK for 'minibrain- related ki-

nase.' They found that the encoded protein kinase enables colon carcinoma cells to survive under certain stress conditions. MIRK is a mitogen- activated protein kinase substrate but is downregulated by activated extracellular signal- regulated kinases (ERKs) in vivo. MIRK contains a PEST region characteristic of rapidly turned over proteins and is broken down to a 57- kD form only in the nucleus. MIRK mRNA levels were elevated in several types of carcinomas, and MIRK protein was detected in each of 7 colon carcinoma cell lines. Mirk was expressed at a higher protein level in Western blots from 3 of 8 colon cancers compared with paired normal colon tissue, suggesting that Mirk plays a role in the evolution of a subset of colon cancers. MIRK is not mutated in colon carcinomas.

[8006]

[8007] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8008] Leder, S.; Weber, Y.; Altafaj, X.; Estivill, X.; Joost, H.- G.; Becker, W. : Cloning and characterization of DYRK1B, a novel member of the DYRK family of protein kinases. Biochem. Biophys. Res. Commun. 254: 474- 479, 1999. ; and

[8009] Lee, K.; Deng, X.; Friedman, E. : Mirk protein kinase is a mitogen- activated protein kinase substrate that mediates survival of colon cancer cells. Cancer Res. 60: 3631-3637, 2000.

[8010] Further studies establishing the function and utilities of DYRK1B are found in John Hopkins OMIM database record ID 604556, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1b (DYRK1B, Accession NP_006475.1) is another GAM63 target gene, herein designated TARGET GENE. DYRK1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DYRK1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYRK1B BINDING SITE, designated SEQ ID:3553, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8011] Another function of GAM63 is therefore inhibition of Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1b (DYRK1B, Accession NP_006475.1), a gene

which is a mitogen- activated dual- specificity protein kinase substrate and therefore may be associated with Colon cancer. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Colon cancer, and of other diseases and clinical conditions associated with DYRK1B.

[8012] The function of DYRK1B has been established by previous studies. The DYRK1A gene (OMIM Ref. No. 600855), located on human chromosome 21 and encoding a dual-specificity protein kinase, is the human homolog of the Drosophila 'minibrain' gene. The minibrain protein product, mnb, is involved in postembryonic neurogenesis. By performing RACE on human testis RNA using primers designed to the catalytic domain of DYRK1A, Leder et al. (1999) isolated a partial DYRK1B cDNA; they obtained the complete coding sequence of human DYRK1B by PCR cloning from human testis cDNA. The putative DYRK1B peptide has a domain structure similar to that of DYRK1A, with a kinase domain flanked by a 110- amino acid N-terminal domain and a 198- amino acid C- terminal domain. Human DYRK1A and DYRK1B proteins are 84% identical in the N- terminal and catalytic domains but show no extended similarity in the C- terminal region. Northern

blot analysis detected a 2.4- kb DYRK1B transcript in testis and skeletal muscle. Expression of DYRK1B as a GFP fusion protein in COS- 7 cells localized the protein to the nucleus. Human and mouse DYRK1B proteins share 97% sequence identity. Lee et al. (2000) cloned the same gene, which they designated MIRK for 'minibrain- related kinase.' They found that the encoded protein kinase enables colon carcinoma cells to survive under certain stress conditions. MIRK is a mitogen- activated protein kinase substrate but is downregulated by activated extracellular signal- regulated kinases (ERKs) in vivo. MIRK contains a PEST region characteristic of rapidly turned over proteins and is broken down to a 57- kD form only in the nucleus. MIRK mRNA levels were elevated in several types of carcinomas, and MIRK protein was detected in each of 7 colon carcinoma cell lines. Mirk was expressed at a higher protein level in Western blots from 3 of 8 colon cancers compared with paired normal colon tissue, suggesting that Mirk plays a role in the evolution of a subset of colon cancers. MIRK is not mutated in colon carcinomas.

[8013]

[8014] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[8015] Leder, S.; Weber, Y.; Altafaj, X.; Estivill, X.; Joost, H.- G.; Becker, W. : Cloning and characterization of DYRK1B, a novel member of the DYRK family of protein kinases. Biochem. Biophys. Res. Commun. 254: 474- 479, 1999. ; and

[8016] Lee, K.; Deng, X.; Friedman, E. : Mirk protein kinase is a mitogen- activated protein kinase substrate that mediates survival of colon cancer cells. Cancer Res. 60: 3631-3637, 2000.

[8017] Further studies establishing the function and utilities of DYRK1B are found in John Hopkins OMIM database record ID 604556, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1b (DYRK1B, Accession NP_006474.1) is another GAM63 target gene, herein designated TARGET GENE. DYRK1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DYRK1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYRK1B BINDING

SITE, designated SEQ ID:3553, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8018] Another function of GAM63 is therefore inhibition of Dual-specificity tyrosine-(y)-phosphorylation regulated kinase 1b (DYRK1B, Accession NP_006474.1), a gene which is a mitogen- activated dual- specificity protein kinase substrate and therefore may be associated with Colon cancer. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Colon cancer, and of other diseases and clinical conditions associated with DYRK1B.

[8019] The function of DYRK1B has been established by previous studies. The DYRK1A gene (OMIM Ref. No. 600855), located on human chromosome 21 and encoding a dual-specificity protein kinase, is the human homolog of the Drosophila 'minibrain' gene. The minibrain protein product, mnb, is involved in postembryonic neurogenesis. By performing RACE on human testis RNA using primers designed to the catalytic domain of DYRK1A, Leder et al. (1999) isolated a partial DYRK1B cDNA; they obtained the complete coding sequence of human DYRK1B by PCR cloning from human testis cDNA. The putative DYRK1B

peptide has a domain structure similar to that of DYRK1A, with a kinase domain flanked by a 110- amino acid N- terminal domain and a 198- amino acid C- terminal domain. Human DYRK1A and DYRK1B proteins are 84% identical in the N- terminal and catalytic domains but show no extended similarity in the C- terminal region. Northern blot analysis detected a 2.4- kb DYRK1B transcript in testis and skeletal muscle. Expression of DYRK1B as a GFP fusion protein in COS- 7 cells localized the protein to the nucleus. Human and mouse DYRK1B proteins share 97% sequence identity. Lee et al. (2000) cloned the same gene, which they designated MIRK for 'minibrain- related kinase.' They found that the encoded protein kinase enables colon carcinoma cells to survive under certain stress conditions. MIRK is a mitogen- activated protein kinase substrate but is downregulated by activated extracellular signal- regulated kinases (ERKs) in vivo. [8021] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8022] Leder, S.; Weber, Y.; Altafaj, X.; Estivill, X.; Joost, H.- G.; Becker, W. : Cloning and characterization of DYRK1B, a novel member of the DYRK family of protein kinases. Biochem. Biophys. Res. Commun. 254: 474- 479, 1999. ; and

[8023] Lee, K.; Deng, X.; Friedman, E. : Mirk protein kinase is a mitogen- activated protein kinase substrate that mediates survival of colon cancer cells. Cancer Res. 60: 3631- 3637, 2000.

[8024] Further studies establishing the function and utilities of DYRK1B are found in John Hopkins OMIM database record ID 604556, and in cited publications listed in Table 5, which are hereby incorporated by reference.EAT2 (Accession NP_444512.1) is another GAM63 target gene, herein designated TARGET GENE. EAT2 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by EAT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EAT2 BINDING SITE, designated SEQ ID:4918, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8025] Another function of GAM63 is therefore inhibition of EAT2 (Accession NP_444512.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EAT2.

[8026] EFS (Accession NP_115835.1) is another GAM63 target gene, herein designated TARGET GENE. EFS BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EFS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EFS BINDING SITE, designated SEQ ID:1802, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8027] Another function of GAM63 is therefore inhibition of EFS (Accession NP_115835.1) . Accordingly, utilities of GAM63

include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFS.

[8028] EFS (Accession NP_005855.1) is another GAM63 target gene, herein designated TARGET GENE. EFS BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EFS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EFS BINDING SITE, designated SEQ ID:1802, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8029] Another function of GAM63 is therefore inhibition of EFS (Accession NP_005855.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFS.

[8030] Early growth response 3 (EGR3, Accession NP_004421.2) is another GAM63 target gene, herein designated TARGET GENE. EGR3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EGR3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of EGR3 BINDING SITE, designated SEQ ID:4416, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8031] Another function of GAM63 is therefore inhibition of Early growth response 3 (EGR3, Accession NP_004421.2), a gene which is a putative transcription factor. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3.

[8032] The function of EGR3 has been established by previous studies. The human EGR3 gene was described by Patwardhan et al. (1991) as predicting a 387- amino acid protein containing 3 C2H2 zinc fingers nearly identical to those of EGR1 and EGR2. The EGR3 gene has a single intron. The gene was known to be induced in various brain regions in response to stress or following focal brain injury. Morris et al. (1998) stated that, in the SCN, it probably participates in the transcriptional regulation of genes in response to retinal input, as had been proposed for FOS. Muscle spindles are skeletal muscle sensory organs that provide axial and limb position information (proprioception) to the central nervous system. Spindles consist of encapsulated muscle fibers (intrafusal fibers)

that are innervated by specialized motor and sensory axons. Tourtellotte and Milbrandt (1998) found that mice rendered deficient in Egr3 by gene targeting had gait ataxia, increased frequency of perinatal mortality, scoliosis, resting tremors, and ptosis. Although extrafusal skeletal muscle fibers appeared normal, Egr3- deficient animals lacked muscle spindles, a finding that is consistent with their profound gait ataxia. Egr3 was highly expressed in developing muscle spindles, but not in IIa afferent neurons or their terminals during developmental periods that coincided with the induction of spindle morphogenesis by sensory afferent axons. These results indicated that type I myotubes are dependent upon Egr3-mediated transcription for proper spindle development.

[8033]

[8034] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8035] Morris, M. E.; Viswanathan, N.; Kuhlman, S.; Davis, F. C.; Weitz, C. J. : A screen for genes induced in the suprachiasmatic nucleus by light. Science 279: 1544- 1547, 1998. ; and

[8036] Tourtellotte, W. G.; Milbrandt, J. : Sensory ataxia and mus-

cle spindle agenesis in mice lacking the transcription factor Egr3. Nature Genet. 20: 87- 91, 1998.

[8037] Further studies establishing the function and utilities of EGR3 are found in John Hopkins OMIM database record ID 602419, and in cited publications listed in Table 5, which are hereby incorporated by reference.Enolase 2, (gamma, neuronal) (ENO2, Accession NP_001966.1) is another GAM63 target gene, herein designated TARGET GENE. ENO2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ENO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENO2 BINDING SITE, designated SEQ ID:13106, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8038] Another function of GAM63 is therefore inhibition of Enolase 2, (gamma, neuronal) (ENO2, Accession NP_001966.1), a gene which converts 2- phospho- D-glycerate to phosphoenolpyruvate in glycolysis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENO2.

[8039] The function of ENO2 has been established by previous studies. The enolases (phosphopyruvate hydratase; EC 4.2.1.11) catalyze the interconversion of 2- phosphoglycerate to phosphoenolpyruvate in the glycolytic pathway. The functional enzyme is a dimer made up of subunits referred to as alpha, beta, and gamma. In mammals there are at least 3 isoforms of enolase characterized by different tissue distributions as well as by distinct biochemical and immunologic properties. The alpha-, or nonneuronal, enolase (ENO1; 172430) is a nearly ubiquitous form, found in almost all tissues, and its expression precedes that of the other isoforms in the early stage of embryonic development. The beta-, or muscle- specific, enolase (ENO3; 131370) is present in adult skeletal muscle, and the gamma-, or neuron- specific, enolase (ENO2) is the major form found in mature neurons and in cells of neuronal origin. Enolase- 2 is determined by a gene on chromosome 12 (Grzeschik, 1976). Herbschleb- Voogt et al. (1978) confirmed assignment to chromosome 12 by showing synteny with LDHB and PEPB in man- mouse hybrids. Mattei et al. (1982) assigned ENO2 to 12p11- qter by study of cells trisomic for 12pter- p11. Law and Kao (1982) also assigned the gene to chromosome 12. By in

situ hybridization, Craig et al. (1989, 1990) localized ENO2 to 12p13. Oliva et al. (1991) demonstrated that the ENO2 gene contains 12 exons distributed over 9,213 nucleotides. The putative promoter region lacks canonical TATA and CAAT boxes, is very G+C- rich, and contains several potential regulatory sequences.

[8040]

[8041] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8042] Oliva, D.; Cali, L.; Feo, S.; Giallongo, A. : Complete structure of the human gene encoding neuron- specific enolase. Genomics 10: 157- 165, 1991. ; and

[8043] Hinks, L. J.; Day, I. N. M. : Further studies of enolase loci. (Abstract) Cytogenet. Cell Genet. 58: 1854 only, 1991.

[8044] Further studies establishing the function and utilities of ENO2 are found in John Hopkins OMIM database record ID 131360, and in cited publications listed in Table 5, which are hereby incorporated by reference.Era g-protein-like 1 (e. coli) (ERAL1, Accession NP_005693.1) is another GAM63 target gene, herein designated TARGET GENE. ERAL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ERAL1, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ERAL1 BINDING SITE, designated SEQ ID:5170, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8045] Another function of GAM63 is therefore inhibition of Era g-protein-like 1 (e. coli) (ERAL1, Accession NP_005693.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAL1.

[8046] V-erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian) (ERBB3, Accession NP_001973.1) is another GAM63 target gene, herein designated TARGET GENE. ERBB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ERBB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ERBB3 BINDING SITE, designated SEQ ID:12198, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8047] Another function of GAM63 is therefore inhibition of V-

erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian) (ERBB3, Accession NP_001973.1), a gene which binds and is activated by neuregulins and ntak. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB3.

[8048] The function of ERBB3 has been established by previous studies. Kraus et al. (1989) detected a DNA fragment related to but distinct from epidermal growth factor receptor (EGFR; 131550) and ERBB2 (OMIM Ref. No. 164870). cDNA cloning showed a predicted 148- kD transmembrane polypeptide with structural features identifying it as a member of the ERBB gene family, prompting the designation ERBB3. Markedly elevated ERBB3 mRNA levels were demonstrated in certain human mammary tumor cell lines, suggesting that it may play a role in some human malignancies just as does EGFR (also called ERBB1). Epidermal growth factor (OMIM Ref. No. 131530), transforming growth factor alpha (OMIM Ref. No. 190170), and amphiregulin (OMIM Ref. No. 104640) are structurally and functionally related growth regulatory proteins. They all are secreted polypeptides that bind to the 170- kD cell-surface EGF receptor, activating its intrinsic kinase activ-

ity. Plowman et al. (1990) speculated that these 3 proteins may differentially interact with a homolog of EGFR. They failed to show any interaction between these 3 secreted growth factors and ERBB2, a known EGFR- related protein. Searching for other members of this family of receptor tyrosine kinases, however, they cloned and studied the expression of ERBB3, which they referred to as HER3. The cDNA was isolated from a human carcinoma cell line, and its 6- kb transcript was identified in various human tissues. Carraway et al. (1994) demonstrated that ERBB3 is a receptor for heregulin (OMIM Ref. No. 142445) and is capable of mediating HGL- stimulated tyrosine phosphorylation of itself. By in situ hybridization, Kraus et al. (1989) mapped the ERBB3 gene to chromosome 12q13.

[8049]

[8050] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8053] Further studies establishing the function and utilities of ERBB3 are found in John Hopkins OMIM database record ID 190151, and in cited publications listed in Table 5, which are hereby incorporated by reference.Extra spindle poles like 1 (s. cerevisiae) (ESPL1, Accession NP_036423.1) is another GAM63 target gene, herein designated TARGET GENE. ESPL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ESPL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ESPL1 BINDING SITE, designated SEQ ID:2372, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8054] Another function of GAM63 is therefore inhibition of Extra spindle poles like 1 (s. cerevisiae) (ESPL1, Accession NP_036423.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ESPL1.

[8055] F11R (Accession NP_058642.1) is another GAM63 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:15037, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8056] Another function of GAM63 is therefore inhibition of F11R (Accession NP_058642.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[8057] F11R (Accession NP_653087.1) is another GAM63 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:15037,

to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8058] Another function of GAM63 is therefore inhibition of F11R (Accession NP_653087.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[8059] F11R (Accession NP_653086.1) is another GAM63 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:15037, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8060] Another function of GAM63 is therefore inhibition of F11R (Accession NP_653086.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[8061] F11R (Accession NP_653085.1) is another GAM63 target gene, herein designated TARGET GENE. F11R BINDING SITE is a target binding site found in the 3` untranslated re-

gion of multiple transcripts of mRNA encoded by F11R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F11R BINDING SITE, designated SEQ ID:15037, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8062] Another function of GAM63 is therefore inhibition of F11R (Accession NP_653085.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F11R.

[8063] Family with sequence similarity 3, member a (FAM3A, Accession NP_068578.1) is another GAM63 target gene, herein designated TARGET GENE. FAM3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FAM3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FAM3A BINDING SITE, designated SEQ ID:11015, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8064] Another function of GAM63 is therefore inhibition of Fam-

ily with sequence similarity 3, member a (FAM3A, Accession NP_068578.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM3A.

[8065] FBXW8 (Accession NP_036306.1) is another GAM63 target gene, herein designated TARGET GENE. FBXW8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:15570, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8066] Another function of GAM63 is therefore inhibition of FBXW8 (Accession NP_036306.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[8067] FBXW8 (Accession NP_699179.2) is another GAM63 target gene, herein designated TARGET GENE. FBXW8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXW8, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXW8 BINDING SITE, designated SEQ ID:15570, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8068] Another function of GAM63 is therefore inhibition of FBXW8 (Accession NP_699179.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW8.

[8069] FLJ00001 (Accession XP_088525.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ00001 BINDING SITE1 and FLJ00001 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ00001, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE1 and FLJ00001 BINDING SITE2, designated SEQ ID:9347 and SEQ ID:3839 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8070] Another function of GAM63 is therefore inhibition of FLJ00001 (Accession XP_088525.2) . Accordingly, utilities

of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001.

[8071] FLJ00024 (Accession XP_033361.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ00024 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:16819, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8072] Another function of GAM63 is therefore inhibition of FLJ00024 (Accession XP_033361.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[8073] FLJ00024 (Accession NP_203745.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ00024 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:16819, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8074] Another function of GAM63 is therefore inhibition of FLJ00024 (Accession NP_203745.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[8075] FLJ00103 (Accession XP_036104.5) is another GAM63 target gene, herein designated TARGET GENE. FLJ00103 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ00103, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00103 BINDING SITE, designated SEQ ID:7642, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8076] Another function of GAM63 is therefore inhibition of FLJ00103 (Accession XP_036104.5) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00103.

[8077] FLJ10900 (Accession NP_060734.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ10900

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10900, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10900 BINDING SITE, designated SEQ ID:16238, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8078] Another function of GAM63 is therefore inhibition of FLJ10900 (Accession NP_060734.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10900.

[8079] FLJ10922 (Accession NP_060743.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ10922 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:16820, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8080] Another function of GAM63 is therefore inhibition of

FLJ10922 (Accession NP_060743.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922.

[8081] FLJ11151 (Accession NP_060810.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ11151 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11151, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11151 BINDING SITE, designated SEQ ID:11328, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8082] Another function of GAM63 is therefore inhibition of FLJ11151 (Accession NP_060810.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11151.

[8083] FLJ12660 (Accession NP_079428.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ12660 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12660, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ12660 BINDING SITE, designated SEQ ID:6133, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8084] Another function of GAM63 is therefore inhibition of FLJ12660 (Accession NP_079428.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12660.

[8085] FLJ13204 (Accession NP_079037.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ13204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:3368, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8086] Another function of GAM63 is therefore inhibition of FLJ13204 (Accession NP_079037.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204.

[8087] FLJ13215 (Accession NP_079280.1) is another GAM63 tar-

get gene, herein designated TARGET GENE. FLJ13215 BINDING SITE1 and FLJ13215 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ13215, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13215 BINDING SITE1 and FLJ13215 BINDING SITE2, designated SEQ ID:18857 and SEQ ID:5332 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8088] Another function of GAM63 is therefore inhibition of FLJ13215 (Accession NP_079280.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13215.

[8089] FLJ13639 (Accession NP_078981.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ13639 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13639, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13639 BINDING SITE, designated SEQ ID:19873, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8090] Another function of GAM63 is therefore inhibition of FLJ13639 (Accession NP_078981.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13639.

[8091] FLJ14007 (Accession NP_078975.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ14007 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14007, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14007 BINDING SITE, designated SEQ ID:11969, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8092] Another function of GAM63 is therefore inhibition of FLJ14007 (Accession NP_078975.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14007.

[8093] FLJ14050 (Accession NP_079145.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ14050 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by FLJ14050, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14050 BINDING SITE, designated SEQ ID:19808, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8094] Another function of GAM63 is therefore inhibition of FLJ14050 (Accession NP_079145.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14050.

[8095] FLJ20487 (Accession NP_060311.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ20487 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20487 BINDING SITE, designated SEQ ID:14156, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8096] Another function of GAM63 is therefore inhibition of FLJ20487 (Accession NP_060311.1) . Accordingly, utilities

of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20487.

[8097] FLJ20619 (Accession NP_060374.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ20619 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20619, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20619 BINDING SITE, designated SEQ ID:9038, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8098] Another function of GAM63 is therefore inhibition of FLJ20619 (Accession NP_060374.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20619.

[8099] FLJ20825 (Accession NP_060432.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ20825 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20825, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ20825 BINDING SITE, designated SEQ ID:1853, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8100] Another function of GAM63 is therefore inhibition of FLJ20825 (Accession NP_060432.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20825.

[8101] FLJ21977 (Accession NP_115589.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ21977 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21977, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21977 BINDING SITE, designated SEQ ID:19347, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8102] Another function of GAM63 is therefore inhibition of FLJ21977 (Accession NP_115589.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21977.

[8103] FLJ22160 (Accession NP_078861.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ22160

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22160, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22160 BINDING SITE, designated SEQ ID:4897, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8104] Another function of GAM63 is therefore inhibition of FLJ22160 (Accession NP_078861.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22160.

[8105] FLJ22169 (Accession NP_076990.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ22169 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:9940, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8106] Another function of GAM63 is therefore inhibition of

FLJ22169 (Accession NP_076990.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169.

[8107] FLJ22329 (Accession NP_078932.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ22329 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22329, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22329 BINDING SITE, designated SEQ ID:2748, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8108] Another function of GAM63 is therefore inhibition of FLJ22329 (Accession NP_078932.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22329.

[8109] FLJ22678 (Accession NP_078812.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ22678 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22678, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ22678 BINDING SITE, designated SEQ ID:5171, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8110] Another function of GAM63 is therefore inhibition of FLJ22678 (Accession NP_078812.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22678.

[8111] FLJ23420 (Accession NP_079337.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ23420 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ23420, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23420 BINDING SITE, designated SEQ ID:20060, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8112] Another function of GAM63 is therefore inhibition of FLJ23420 (Accession NP_079337.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23420.

[8113] FLJ30317 (Accession NP_742148.1) is another GAM63 tar-

get gene, herein designated TARGET GENE. FLJ30317 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30317, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30317 BINDING SITE, designated SEQ ID:19586, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8114] Another function of GAM63 is therefore inhibition of FLJ30317 (Accession NP_742148.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30317.

[8115] FLJ30473 (Accession NP_653305.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ30473 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30473, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30473 BINDING SITE, designated SEQ ID:18935, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8116] Another function of GAM63 is therefore inhibition of FLJ30473 (Accession NP_653305.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30473.

[8117] FLJ31131 (Accession NP_689748.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ31131 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31131, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31131 BINDING SITE, designated SEQ ID:15810, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8118] Another function of GAM63 is therefore inhibition of FLJ31131 (Accession NP_689748.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31131.

[8119] FLJ31713 (Accession NP_689788.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ31713 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31713, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31713 BINDING SITE, designated SEQ ID:19852, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8120] Another function of GAM63 is therefore inhibition of FLJ31713 (Accession NP_689788.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31713.

[8121] FLJ31819 (Accession NP_689742.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ31819 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31819, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31819 BINDING SITE, designated SEQ ID:18693, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8122] Another function of GAM63 is therefore inhibition of FLJ31819 (Accession NP_689742.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31819.

[8123] FLJ31821 (Accession NP_694574.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ31821 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ31821, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31821 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8124] Another function of GAM63 is therefore inhibition of FLJ31821 (Accession NP_694574.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31821.

[8125] FLJ32065 (Accession NP_694577.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ32065 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32065, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32065 BINDING SITE, designated SEQ ID:15838, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[8126] Another function of GAM63 is therefore inhibition of FLJ32065 (Accession NP_694577.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32065.

[8127] FLJ32069 (Accession NP_694578.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ32069 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32069, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32069 BINDING SITE, designated SEQ ID:10747, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8128] Another function of GAM63 is therefore inhibition of FLJ32069 (Accession NP_694578.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32069.

[8129] FLJ32784 (Accession NP_653224.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ32784 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32784, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32784 BINDING SITE, designated SEQ ID:7437, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8130] Another function of GAM63 is therefore inhibition of FLJ32784 (Accession NP_653224.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32784.

[8131] FLJ33610 (Accession NP_775968.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ33610 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33610, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33610 BINDING SITE, designated SEQ ID:17301, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8132] Another function of GAM63 is therefore inhibition of FLJ33610 (Accession NP_775968.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ33610.

[8133] FLJ33641 (Accession NP_689900.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ33641 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33641, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33641 BINDING SITE, designated SEQ ID:15987, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8134] Another function of GAM63 is therefore inhibition of FLJ33641 (Accession NP_689900.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33641.

[8135] FLJ33817 (Accession NP_689561.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ33817 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33817 BINDING SITE, designated SEQ ID:19519, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8136] Another function of GAM63 is therefore inhibition of FLJ33817 (Accession NP_689561.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33817.

[8137] FLJ35220 (Accession NP_775898.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ35220 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35220 BINDING SITE, designated SEQ ID:7479, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8138] Another function of GAM63 is therefore inhibition of FLJ35220 (Accession NP_775898.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35220.

[8139] FLJ35283 (Accession NP_689915.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ35283 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ35283, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35283 BINDING SITE, designated SEQ ID:19021, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8140] Another function of GAM63 is therefore inhibition of FLJ35283 (Accession NP_689915.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35283.

[8141] FLJ35613 (Accession NP_775924.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ35613 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35613, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35613 BINDING SITE, designated SEQ ID:6698, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8142] Another function of GAM63 is therefore inhibition of FLJ35613 (Accession NP_775924.1) . Accordingly, utilities

of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35613.

[8143] FLJ37478 (Accession NP_848652.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ37478 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37478, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37478 BINDING SITE, designated SEQ ID:7911, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8144] Another function of GAM63 is therefore inhibition of FLJ37478 (Accession NP_848652.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37478.

[8145] FLJ38628 (Accession NP_689480.2) is another GAM63 target gene, herein designated TARGET GENE. FLJ38628 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38628, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ38628 BINDING SITE, designated SEQ ID:3281, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8146] Another function of GAM63 is therefore inhibition of FLJ38628 (Accession NP_689480.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38628.

[8147] FLJ38792 (Accession NP_848615.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ38792 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38792, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38792 BINDING SITE, designated SEQ ID:2686, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8148] Another function of GAM63 is therefore inhibition of FLJ38792 (Accession NP_848615.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38792.

[8149] FLJ39249 (Accession NP_775935.1) is another GAM63 target gene, herein designated TARGET GENE. FLJ39249

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39249, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39249 BINDING SITE, designated SEQ ID:16239, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8150] Another function of GAM63 is therefore inhibition of FLJ39249 (Accession NP_775935.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39249.

[8151] Flavin containing monooxygenase 4 (FMO4, Accession NP_002013.1) is another GAM63 target gene, herein designated TARGET GENE. FMO4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FMO4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FMO4 BINDING SITE, designated SEQ ID:13036, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8152] Another function of GAM63 is therefore inhibition of

Flavin containing monooxygenase 4 (FMO4, Accession NP_002013.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMO4.

[8153] Frequenin homolog (drosophila) (FREQ, Accession NP_055101.2) is another GAM63 target gene, herein designated TARGET GENE. FREQ BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FREQ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FREQ BINDING SITE, designated SEQ ID:12692, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8154] Another function of GAM63 is therefore inhibition of Frequenin homolog (drosophila) (FREQ, Accession NP_055101.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREQ.

[8155] Ferritin, light polypeptide (FTL, Accession NP_000137.2) is another GAM63 target gene, herein designated TARGET GENE. FTL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FTL, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FTL BINDING SITE, designated SEQ ID:15882, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8156] Another function of GAM63 is therefore inhibition of Ferritin, light polypeptide (FTL, Accession NP_000137.2), a gene which stores iron in a soluble, nontoxic, readily available form. and therefore is associated with Hereditary hyperferritinemia- cataract syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Hereditary hyperferritinemia- cataract syndrome, and of other diseases and clinical conditions associated with FTL.

[8157] The function of FTL has been established by previous studies. Beaumont et al. (1995) identified a mutation in the iron- responsive element (IRE) in the 5- prime noncoding region of the FTL gene (134790.0001) in the hyperferritinemia- cataract syndrome (OMIM Ref. No. 600886). Ferritin is the major intracellular iron storage protein in all organisms. It has the shape of a hollow sphere that permits entry of a variable amount of iron for

storage as ferric hydroxide phosphate complexes. Mammalian liver and spleen ferritin (relative mass about 450,000) consists of 24 subunits of 2 species, the heavy subunit (relative mass = 21,000) and the light subunit (relative mass = 19,000). Brown et al. (1983) presented evidence that, in the rat, the 2 species of subunits are coded by separate mRNAs. Furthermore, a family of genes appear to encode the light subunit. Studies of ferritin synthesis in cell- free systems suggested that the H and L subunits have different mRNA molecules (Watanabe and Drysdale, 1981). By study of human/Chinese hamster hybrid cells and use of a radioimmunoassay specific for human ferritin, Caskey et al. (1983) showed that chromosome 19 encodes the structural gene for ferritin. Thus, mutation in the structural gene for ferritin is not responsible for hemochromatosis (OMIM Ref. No. 235200), since that disorder is coded by chromosome 6. By in situ hybridization, McGill et al. (1984) confirmed the assignment of the light chain gene to chromosome 19 but concluded that the heavy chain is encoded by 1p. By study of hamster- human and mouse- human hybrid cells, some with translocations involving chromosome 19, Worwood et al. (1985) concluded that light subunits of ferritin (rich in hu-

man spleen ferritin) are coded by a gene in segment 19q13.3- qter and that the gene for the heavy subunit (rich in human heart ferritin) is located on chromosome 11. By miniaturized restriction enzyme analysis of sorted chromosomes, Lebo et al. (1985) demonstrated ferritin light- chain genes on at least 3 chromosomes. Munro et al. (1988) reviewed information on the ferritin genes. They pointed out that in both the rat and the human, several ferritin pseudogenes can be recognized not only because they are flanked by 5- prime and 3- prime direct repeats representing the site of their retroinsertion into the chromatin, but also because they differ from functional genes by the absence of introns and by the presence of polyadenylic acid tails that have been inserted onto the 3-prime end of the messenger transcription of the functional gene. They cited the evidence of Santoro et al. (1986) and of Hentze et al. (1986) that there is only one expressed H and one expressed L gene in the human genome.

[8158]

[8159] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8160] Beaumont, C.; Leneuve, P.; Devaux, I.; Scoazec, J.- Y.; Berthier, M.; Loiseau, M.- N.; Grandchamp, B.; Bonneau, D. : Mutation in the iron responsive element of the L ferritin mRNA in a family with dominant hyperferritinaemia and cataract. Nature Genet. 11: 444- 446, 1995. ; and

[8161] Worwood, M.; Brook, J. D.; Cragg, S. J.; Hellkuhl, B.; Jones, B. M.; Perera, P.; Roberts, S. H.; Shaw, D. J. : Assignment of human ferritin genes to chromosomes 11 and 19q13.3-19qter. H.

[8162] Further studies establishing the function and utilities of FTL are found in John Hopkins OMIM database record ID 134790, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fyve and coiled-coil domain containing 1 (FYCO1, Accession NP_078789.1) is another GAM63 target gene, herein designated TARGET GENE. FYCO1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FYCO1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:19663, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8163] Another function of GAM63 is therefore inhibition of Fyve and coiled-coil domain containing 1 (FYCO1, Accession NP_078789.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1.

[8164] Grb2-associated binding protein 2 (GAB2, Accession NP_036428.1) is another GAM63 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:7245, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8165] Another function of GAM63 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NP_036428.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[8166] The function of GAB2 has been established by previous

studies. The GAB2 gene encodes a 100- kd adapter molecule that is the principal activator of phosphatidylinositol- 3 kinase (PIK3; OMIM Ref. No. 171833) in response to activation of the high affinity IgE receptor (see OMIM Ref. No. 147140). Zhao et al. (1999) demonstrated that upon tyrosine phosphorylation, GAB2 physically interacts with SHP2 tyrosine phosphatase and GRB2 adapter protein (OMIM Ref. No. 604330). GAB2 has an inhibitory effect on the activation of ELK1 (OMIM Ref. No. 311040)-dependent transcription triggered by a dominant active Ras (OMIM Ref. No. 190020) mutant or under growth factor stimulation, whereas GAB1 acts to potentiate slightly the ELK1 activity in the same system. In contrast to the reciprocal effects of GAB1 and GAB2 in mediating ELK1 induction, these 2 molecules have a similar function in extracellular signal- regulated kinase activation induced by either oncogenic Ras or growth factor stimulation. Zhao et al. (1999) concluded that GAB1 and GAB2 may have distinct roles in coupling cytoplasmic- nuclear signal transduction.

[8167] Animal model experiments lend further support to the function of GAB2. Gu et al. (2001) generated mice deficient in Gab2 by homologous recombination. Gab2 - /-

mice were viable and generally healthy; however, the response of Gab2 - /- mast cells to stimulation of the high affinity IgE receptor Fc- epsilon- RI (see OMIM Ref. No. 147140) was defective. Accordingly, allergic reactions, such as passive cutaneous and systemic anaphylaxis, were markedly impaired in Gab - /- mice. Biochemical analyses revealed that signaling pathways dependent on phosphatidylinositol- 3 hydroxykinase (PI3K), a critical component of the Fc- epsilon- RI signaling, were defective in Gab2 - /- mast cells. Gu et al. (2001) concluded that GAB2 is the principal activator of PI3K in response to Fc-epsilon- RI activation, thereby providing genetic evidence that Dos/Gab family scaffolds regulate the PI3K pathway in vivo.

[8168] It is appreciated that the abovementioned animal model for GAB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8169] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8170] Gu, H.; Saito, K.; Klaman, L. D.; Shen, J.; Fleming, T.; Wang, Y.- P.; Pratt, J. C.; Lin, G.; Lim, B.; Kinet, J.- P.; Neel,

[8171] Zhao, C.; Yu, D.- H.; Shen, R.; Feng, G.- S. : Gab2, a new pleckstrin homology domain- containing adapter protein, acts to uncouple signaling from ERK kinase to Elk- 1. J. Biol. Chem. 274.

[8172] Further studies establishing the function and utilities of GAB2 are found in John Hopkins OMIM database record ID 606203, and in cited publications listed in Table 5, which are hereby incorporated by reference.Grb2-associated binding protein 2 (GAB2, Accession NP_536739.1) is another GAM63 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:7245, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8173] Another function of GAM63 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NP_536739.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[8174] The function of GAB2 has been established by previous studies. The GAB2 gene encodes a 100- kd adapter molecule that is the principal activator of phosphatidylinositol- 3 kinase (PIK3; OMIM Ref. No. 171833) in response to activation of the high affinity IgE receptor (see OMIM Ref. No. 147140). Zhao et al. (1999) demonstrated that upon tyrosine phosphorylation, GAB2 physically interacts with SHP2 tyrosine phosphatase and GRB2 adapter protein (OMIM Ref. No. 604330). GAB2 has an inhibitory effect on the activation of ELK1 (OMIM Ref. No. 311040)-dependent transcription triggered by a dominant active Ras (OMIM Ref. No. 190020) mutant or under growth factor stimulation, whereas GAB1 acts to potentiate slightly the ELK1 activity in the same system. In contrast to the reciprocal effects of GAB1 and GAB2 in mediating ELK1 induction, these 2 molecules have a similar function in extracellular signal- regulated kinase activation induced by

either oncogenic Ras or growth factor stimulation. Zhao et al. (1999) concluded that GAB1 and GAB2 may have distinct roles in coupling cytoplasmic- nuclear signal transduction.

[8175] Animal model experiments lend further support to the function of GAB2. Gu et al. (2001) generated mice deficient in Gab2 by homologous recombination. Gab2 - /- mice were viable and generally healthy; however, the response of Gab2 - /- mast cells to stimulation of the high affinity IgE receptor Fc- epsilon- RI (see OMIM Ref. No. 147140) was defective. Accordingly, allergic reactions, such as passive cutaneous and systemic anaphylaxis, were markedly impaired in Gab - /- mice. Biochemical analyses revealed that signaling pathways dependent on phosphatidylinositol- 3 hydroxykinase (PI3K), a critical component of the Fc- epsilon- RI signaling, were defective in Gab2 - /- mast cells. Gu et al. (2001) concluded that GAB2 is the principal activator of PI3K in response to Fc- epsilon- RI activation, thereby providing genetic evidence that Dos/Gab family scaffolds regulate the PI3K pathway in vivo.

[8176] It is appreciated that the abovementioned animal model for GAB2 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8177] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8178] Gu, H.; Saito, K.; Klaman, L. D.; Shen, J.; Fleming, T.; Wang, Y.- P.; Pratt, J. C.; Lin, G.; Lim, B.; Kinet, J.- P.; Neel, B. G. : Essential role for Gab2 in the allergic response. Nature 412: 186- 190, 2001. ; and

[8179] Zhao, C.; Yu, D.- H.; Shen, R.; Feng, G.- S. : Gab2, a new pleckstrin homology domain- containing adapter protein, acts to uncouple signaling from ERK kinase to Elk- 1. J. Biol. Chem. 274.

[8180] Further studies establishing the function and utilities of GAB2 are found in John Hopkins OMIM database record ID 606203, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_001461.1) is another GAM63 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:19441, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8181] Another function of GAM63 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_001461.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[8182] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068704.1) is another GAM63 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:19441, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8183] Another function of GAM63 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1,

Accession NP_068704.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[8184] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) is another GAM63 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:19441, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8185] Another function of GAM63 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[8186] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068703.1) is another GAM63 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region

of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:19441, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8187] Another function of GAM63 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068703.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[8188] Gata binding protein 4 (GATA4, Accession NP_002043.1) is another GAM63 target gene, herein designated TARGET GENE. GATA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GATA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GATA4 BINDING SITE, designated SEQ ID:980, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8189] Another function of GAM63 is therefore inhibition of Gata

binding protein 4 (GATA4, Accession NP_002043.1), a gene which regulates genes critical for myocardial differentiation and function. and therefore may be associated with Cardiac hypertrophy and sex cord- derived ovarian tumors. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Cardiac hypertrophy and sex cord- derived ovarian tumors., and of other diseases and clinical conditions associated with GATA4.

[8190] The function of GATA4 has been established by previous studies. Hasegawa et al. (1997) presented evidence implicating GATA4 as a mediator of changes in gene expression associated with cardiac hypertrophy. The authors injected a luciferase reporter construct driven by the cardiac beta- myosin heavy chain (MYH7; 160760) promoter region into rat myocardium in vivo. Cardiac hypertrophy was induced by surgical aortic constriction. Reporter gene expression in hypertrophic myocardium after 23 days was 3 times higher than that in sham controls (P less than 0.005); however, mutation of the GATA motif markedly reduced this response. Hasegawa et al. (1997) concluded that interaction between GATA4 and the GATA element plays a role in the transcriptional activation of MYH7 during pressure overload cardiac hypertrophy.

[8191] Animal model experiments lend further support to the function of GATA4. Crispino et al. (2001) created mice harboring a single amino acid replacement in Gata4 that impaired the ability of the protein to interact with Fog2. These mice died just after embryonic day 12.5 and exhibited features similar to Fog2- null embryos, most notably absence of coronary vasculature and reduced staining for Flk1 (OMIM Ref. No. 191306) and intracellular adhesion molecule- 2 (ICAM2; 146630). However, the Gata4 mutant mice also showed semilunar cardiac valve defects and a double- outlet right ventricle not seen in Fog2- null mice. Crispino et al. (2001) concluded that GATA4 function is dependent on interaction with FOG2 and likely with an additional cardiac- specific FOG protein.

[8192] It is appreciated that the abovementioned animal model for GATA4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8194] Crispino, J. D.; Lodish, M. B.; Thurberg, B. L.; Litovsky, S. H.; Collins, T.; Molkentin, J. D.; Orkin, S. H. : Proper coro-

nary vascular development and heart morphogenesis depend on interaction of GATA- 4 with FOG cofactors. Genes Dev. 15: 839- 844, 2001. ; and

[8195] Hasegawa, K.; Lee, S. J.; Jobe, S. M.; Markham, B. E.; Kitsis, R. N. : cis- acting sequences that mediate induction of beta- myosin heavy chain gene expression during left ventricular hyp.

[8196] Further studies establishing the function and utilities of GATA4 are found in John Hopkins OMIM database record ID 600576, and in cited publications listed in Table 5, which are hereby incorporated by reference.Golgi-specific brefeldin a resistance factor 1 (GBF1, Accession NP_004184.1) is another GAM63 target gene, herein designated TARGET GENE. GBF1 BINDING SITE1 and GBF1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GBF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GBF1 BINDING SITE1 and GBF1 BINDING SITE2, designated SEQ ID:2843 and SEQ ID:12139 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8197] Another function of GAM63 is therefore inhibition of Golgi-specific brefeldin a resistance factor 1 (GBF1, Accession NP_004184.1), a gene which promotes guanine-nucleotide exchange on arf5. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBF1.

[8198] The function of GBF1 has been established by previous studies. Members of the Sec7 domain family share a conserved region that forms a catalytic fold with guanine nucleotide exchange activity. In vitro, the Sec7 domain of several proteins catalyzes the activation of ADP- ribosylation factors (ARFs; OMIM Ref. No. 103180), suggesting that members of the Sec7 domain family represent specific guanine nucleotide exchange factors for the ARF GTPase family. Nagase et al. (1996) isolated KIAA0248, a partial cDNA from immature myeloid cells encoding a protein with homology to S. cerevisiae Sec7. Using 5-prime RACE, Mansour et al. (1998) isolated a cDNA corresponding to the remainder of the coding sequence. They designated the gene GBF1 (Golgi- specific brefeldin A resistance factor- 1). The predicted 1,859- amino acid protein has a pI of 5.55 and contains a Sec7 domain and a proline- rich C terminus. A 7- kb GBF1 mRNA was ex-

pressed in all tissues tested by Northern blot analysis. By analysis of a somatic cell hybrid panel and by fluorescence in situ hybridization, Mansour et al. (1998) mapped the GBF1 gene to 10q24. Another Sec7 domain family member, PSD (OMIM Ref. No. 602327), maps to the same region.

[8199]

[8200] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8201] Mansour, S. J.; Herbrick, J.- A.; Scherer, S. W.; Melancon, P. : Human GBF1 is a ubiquitously expressed gene of the Sec7 domain family mapping to 10q24. Genomics 54: 323- 327, 1998. ; and

[8202] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human g.

[8203] Further studies establishing the function and utilities of GBF1 are found in John Hopkins OMIM database record ID 603698, and in cited publications listed in Table 5, which are hereby incorporated by reference.GENX-3414 (Accession NP_003934.1) is another GAM63 target gene,

herein designated TARGET GENE. GENX-3414 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GENX-3414, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GENX-3414 BINDING SITE, designated SEQ ID:3554, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8204] Another function of GAM63 is therefore inhibition of GENX-3414 (Accession NP_003934.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GENX-3414.

[8205] Gamma-glutamyltransferase-like activity 1 (GGTLA1, Accession NP_004112.1) is another GAM63 target gene, herein designated TARGET GENE. GGTLA1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GGTLA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GGTLA1 BINDING SITE, designated SEQ ID:9172, to the nucleotide sequence

of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8206] Another function of GAM63 is therefore inhibition of Gamma-glutamyltransferase-like activity 1 (GGTLA1, Accession NP_004112.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGTLA1.

[8207] G protein-coupled receptor 56 (GPR56, Accession NP_005673.2) is another GAM63 target gene, herein designated TARGET GENE. GPR56 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR56 BINDING SITE, designated SEQ ID:11435, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8208] Another function of GAM63 is therefore inhibition of G protein-coupled receptor 56 (GPR56, Accession NP_005673.2), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

GPR56.

[8209] The function of GPR56 has been established by previous studies. G protein- coupled receptors (GPRs), which are characterized by the presence of 7 transmembrane domains, are divided into several classes based on sequence characteristics. Class B GPRs, or the secretin- like receptors, include the secretin receptor (OMIM Ref. No. 182098) and the calcitonin receptor (OMIM Ref. No. 114131). The orphan receptors HE6 (OMIM Ref. No. 602657), CD97 (OMIM Ref. No. 601211), EMR1 (OMIM Ref. No. 600493), and BAI1 (OMIM Ref. No. 602682) share significant homology with class B GPRs across the 7- transmembrane region, but have a distinct N- terminal region containing a characteristic cysteine box, which precedes the first membrane- spanning domain, and a mucin- like domain. By PCR of human cDNAs with degenerate primers based on conserved regions from secretin- like receptors, Liu et al. (1999) isolated a cDNA encoding a novel receptor, which they designated GPR56. The predicted 693- amino acid GPR56 protein shares 26 to 32% sequence identity with the 4 class B- like orphan receptors. Like these receptors, GPR56 contains 7 transmembrane domains as well as a mucin- like domain and cysteine box in the N- terminal

region. Northern blot analysis revealed that the GPR56 gene was expressed as a 3- kb mRNA in a wide range of tissues, with the highest levels in thyroid. Using in situ hybridization, Liu et al. (1999) determined that the GPR56 gene was expressed selectively within the monolayer of cuboidal epithelial cells of the smaller, more actively secreting follicles of human thyroid. The GPR56 gene contains 13 exons and spans approximately 15 kb. Using differential display, Zendman et al. (1999) identified a GPR56 cDNA as a transcript that was differentially expressed in melanoma cell lines with different metastatic potential. They designated the gene TM7XN1 (7- transmembrane protein with no EGF- like N- terminal domains- 1) because the protein lacks the EGF- like domains found in the related GPRs CD97 and EMR1. Zendman et al. (1999) reported that the TM7XN1 protein contains 687 amino acids. RT- PCR and Northern blot analyses indicated that TM7XN1 gene expression was inversely correlated with metastatic potential in melanoma cell lines.

[8210]

[8211] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8212] Liu, M.; Parker, R. M. C.; Darby, K.; Eyre, H. J.; Copeland, N. G.; Crawford, J.; Gilbert, D. J.; Sutherland, G. R.; Jenkins, N. A.; Herzog, H. : GPR56, a novel secretin- like human G-protein- coupled receptor gene. Genomics 55: 296- 305, 1999. ; and

[8213] Zendman, A. J. W.; Cornelissen, I. M. H. A.; Weidle, U. H.; Ruiter, D. J.; van Muijen, G. N. P. : TM7XN1, a novel human EGF- TM7- like cDNA, detected with mRNA differential display using.

[8214] Further studies establishing the function and utilities of GPR56 are found in John Hopkins OMIM database record ID 604110, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glutamate receptor, ionotropic, delta 1 (GRID1, Accession XP_043613.8) is another GAM63 target gene, herein designated TARGET GENE. GRID1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRID1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:15134, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8215] Another function of GAM63 is therefore inhibition of Glutamate receptor, ionotropic, delta 1 (GRID1, Accession XP_043613.8) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1.

[8216] Glutamate receptor, metabotropic 6 (GRM6, Accession NP_000834.1) is another GAM63 target gene, herein designated TARGET GENE. GRM6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GRM6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, designated SEQ ID:4232, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8217] Another function of GAM63 is therefore inhibition of Glutamate receptor, metabotropic 6 (GRM6, Accession NP_000834.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6.

[8218] Glycogen synthase 1 (muscle) (GYS1, Accession NP_002094.2) is another GAM63 target gene, herein designated TARGET GENE. GYS1 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by GYS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GYS1 BINDING SITE, designated SEQ ID:14495, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8219] Another function of GAM63 is therefore inhibition of Glycogen synthase 1 (muscle) (GYS1, Accession NP_002094.2), a gene which transfers the glycosyl residue from udp- glc to the nonreducing end of alpha- 1,4- glucan. and therefore may be associated with Type 2 diabetes. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Type 2 diabetes, and of other diseases and clinical conditions associated with GYS1.

[8220] The function of GYS1 has been established by previous studies. To examine whether defective muscle GYS1 expression is associated with impaired glycogen synthesis in type 2 diabetes and whether the defect is inherited or acquired, Huang et al. (2000) measured GYS1 gene expression and enzyme activity in muscle biopsies taken before and after an insulin clamp in 12 monozygotic twin pairs discordant for type 2 diabetes and in 12 matched control

subjects. The effect of insulin on GYS1 fractional activity, when expressed as the increment over the basal values, was significantly impaired in diabetic (15.7 +/- 3.3%; P less than 0.01), but not in nondiabetic (23.7 +/- 1.8%; P = NS) twins compared with that in control subjects (28.1 +/- 2.3%). Insulin increased GYS1 mRNA expression in control subjects (from 0.14 +/- 0.02 to 1.74 +/- 0.10 relative units; P less than 0.01) and in nondiabetic (from 0.24 +/- 0.05 to 1.81 +/- 0.16 relative units; P less than 0.01) and diabetic (from 0.20 +/- 0.07 to 1.08 +/- 0.14 relative units; P less than 0.01) twins. The effect of insulin on GYS1 expression was, however, significantly reduced in the diabetic (P less than 0.003), but not in the nondiabetic, twins, compared with that in control subjects. The postclamp GYS1 mRNA levels correlated strongly with the hemoglobin A1c levels (r = - 0.61; P less than 0.001). The authors concluded that insulin stimulates GYS1 mRNA expression and that impaired stimulation of GYS1 gene expression by insulin in patients with type 2 diabetes is acquired and most likely is secondary to chronic hyperglycemia. Inbred mouse strains fed on a diabetogenic diet (high in fat and sucrose) differ in their propensities to develop features analogous to type 2 diabetes mellitus. To

define chromosomal locations that control these characteristics, Seldin et al. (1994) studied recombinant inbred strains from diabetes- prone C57BL/6J and diabetes- resistant A/J strains. Hyperglycemia correlated with the marker D7Mit25 on mouse chromosome 7. This putative susceptibility locus is consistent with that of the glycogen synthase gene, which was implicated by Groop et al. (1993) in the pathogenesis of type 2 diabetes in the human. Seldin et al. (1994) found that fractional glycogen synthase activity in isolated muscle was significantly lower in normal B/6J diabetes- prone mice than in normal diabetes- resistant A/J mice, a finding similar to that reported in relatives of human patients with type 2 diabetes.

[8221]

[8222] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Kingsmore, S. F.; Bogardus, C.; Opara, E.; Feinglos, M. N.; Surwit, R. S. : Glycogen synthase: a putative locus for diet-induc.

[8225] Further studies establishing the function and utilities of GYS1 are found in John Hopkins OMIM database record ID 138570, and in cited publications listed in Table 5, which are hereby incorporated by reference.Histone deacetylase 7a (HDAC7A, Accession NP_057680.2) is another GAM63 target gene, herein designated TARGET GENE. HDAC7A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HDAC7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HDAC7A BINDING SITE, designated SEQ ID:13926, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8226] Another function of GAM63 is therefore inhibition of Histone deacetylase 7a (HDAC7A, Accession NP_057680.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC7A.

[8227] Histone deacetylase 7a (HDAC7A, Accession

NP_056216.1) is another GAM63 target gene, herein designated TARGET GENE. HDAC7A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HDAC7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HDAC7A BINDING SITE, designated SEQ ID:13926, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8228] Another function of GAM63 is therefore inhibition of Histone deacetylase 7a (HDAC7A, Accession NP_056216.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC7A.

[8229] HEMK (Accession NP_057257.1) is another GAM63 target gene, herein designated TARGET GENE. HEMK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:13927, to the nucleotide se-

quence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8230] Another function of GAM63 is therefore inhibition of HEMK (Accession NP_057257.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK.

[8231] HH114 (Accession NP_115888.1) is another GAM63 target gene, herein designated TARGET GENE. HH114 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HH114, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HH114 BINDING SITE, designated SEQ ID:14866, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8232] Another function of GAM63 is therefore inhibition of HH114 (Accession NP_115888.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HH114.

[8233] Hypoxia inducible factor 3, alpha subunit (HIF3A, Accession NP_690007.1) is another GAM63 target gene, herein designated TARGET GENE. HIF3A BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HIF3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIF3A BINDING SITE, designated SEQ ID:11103, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8234] Another function of GAM63 is therefore inhibition of Hypoxia inducible factor 3, alpha subunit (HIF3A, Accession NP_690007.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIF3A.

[8235] Human immunodeficiency virus type i enhancer binding protein 3 (HIVEP3, Accession NP_078779.1) is another GAM63 target gene, herein designated TARGET GENE. HIVEP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIVEP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIVEP3 BINDING SITE, designated SEQ ID:11510, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[8236] Another function of GAM63 is therefore inhibition of Human immunodeficiency virus type i enhancer binding protein 3 (HIVEP3, Accession NP_078779.1), a gene which is required for transcriptional activation of glucose- repressible alcohol dehydrogenase (adh2). Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIVEP3.

[8237] The function of HIVEP3 has been established by previous studies. Hicar et al. (2001) cloned HIVEP3, a member of the HIVEP family (see OMIM Ref. No. HIVEP1; 194540). HIVEPs encode large zinc finger proteins and regulate transcription via the kappa- B enhancer motif. HIVEP3 is homologous to the mouse Krc (kappa- B- binding and recognition component of the V(D)J recombination signal sequence) protein. The largest open reading frame of HIVEP3 contains 2,406 amino acids and is 80% identical to Krc. RNA studies showed that multiple HIVEP3 transcripts are differentially expressed and regulated. Transcription termination occurs in the ultimate exon, exon 10, or in exon 6. Therefore, HIVEP3 may produce protein isoforms that contain or exclude the C- terminal DNA- binding do-

main and the leucine zipper by alternative RNA splicing and differential polyadenylation. GENE FUNCTION Oukka et al. (2002) described a function for the zinc finger transcription factor Krc in regulating patterns of gene activation in response to proinflammatory stimuli. Krc overexpression inhibited, while antisense or dominant- negative Krc enhanced, NF- kappa- B (OMIM Ref. No. 164011)- dependent transactivation and JNK (OMIM Ref. No. 601158) phosphorylation and consequently inhibited apoptosis and cytokine gene expression. The effect of Krc was mediated through its interaction with the adaptor protein TRAF2 (OMIM Ref. No. 601895). Oukka et al. (2002) concluded that Krc is a participant in the signal transduction pathway leading from the TNF receptor (see OMIM Ref. No. 602746) to gene activation and may play a critical role in inflammatory and apoptotic responses.

[8238]

[8239] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8240] Hicar, M. D.; Liu, Y.; Allen, C. E.; Wu, L.- C. : Structure of the human zinc finger protein HIVEP3: molecular cloning, expression, exon- intron structure, and comparison with

paralogous genes HIVEP1 and HIVEP2. Genomics 71: 89-100, 2001. ; and

[8241] Oukka, M.; Kim, S. T.; Lugo, G.; Sun, J.; Wu, L.- C.; Glimcher, L. H. : A mammalian homolog of Drosophila schnurri, KRC, regulates TNF receptor- driven responses and interacts with TRAF2.

[8242] Further studies establishing the function and utilities of HIVEP3 are found in John Hopkins OMIM database record ID 606649, and in cited publications listed in Table 5, which are hereby incorporated by reference.Heterogeneous nuclear ribonucleoprotein d-like (HNRPDL, Accession NP_005454.1) is another GAM63 target gene, herein designated TARGET GENE. HNRPDL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPDL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:17189, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8243] Another function of GAM63 is therefore inhibition of Heterogeneous nuclear ribonucleoprotein d-like (HNRPDL,

Accession NP_005454.1), a gene which binds to rna molecules that contain au- rich elements. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL.

[8244] The function of HNRPDL has been established by previous studies. Kamei et al. (1999) identified 2 isoforms of HNRPDL, which they called JKTBP1 and JKTBP2, corresponding to the 1.4- and 2.8- kb transcripts identified by Tsuchiya et al. (1998), respectively. The larger transcript predicts a 420- amino acid protein with a calculated molecular mass of approximately 46.4 kD. The JKTBP2 protein has a longer N terminus, and both proteins contain multiple potential sites for phosphorylation and arginine methylation. Northern blot analysis showed that both transcripts were expressed in all tissues examined, although the amounts and ratios of the transcripts varied in different tissues. Three JKTBP transcripts greater than 2.8 kb were expressed in pancreas, spleen, and thymus. Western blot analysis of myeloid leukemia cells showed proteins of 38 and 53 kD. Tsuchiya et al. (1998) determined that recombinant HNRPDL interacted with both the double- and single- stranded forms of JKT41, an oligodeoxynucleotide

corresponding to the cis- acting element in intron 9 of the MPO gene. Recombinant HNRPDL also interacted with poly(G) and poly(A), but not with poly(U) or poly(C). Transient expression of HNRPDL repressed expression of reporter genes located downstream of the intron 9 element of JKT41 or the intron 7 element of FERE27, another oligodeoxynucleotide corresponding to MPO.

[8245]

[8246] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8249] Further studies establishing the function and utilities of HNRPDL are found in John Hopkins OMIM database record ID 607137, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Heterogeneous nuclear ribonucleoprotein d-like (HNRPDL, Accession NP_112740.1) is another GAM63 target gene, herein designated TARGET GENE. HNRPDL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPDL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:17189, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8250] Another function of GAM63 is therefore inhibition of Heterogeneous nuclear ribonucleoprotein d-like (HNRPDL, Accession NP_112740.1), a gene which binds to rna molecules that contain au- rich elements. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL.

[8251] The function of HNRPDL has been established by previous studies. Kamei et al. (1999) identified 2 isoforms of HNRPDL, which they called JKTBP1 and JKTBP2, corresponding to the 1.4- and 2.8- kb transcripts identified by Tsuchiya

et al. (1998), respectively. The larger transcript predicts a 420- amino acid protein with a calculated molecular mass of approximately 46.4 kD. The JKTBP2 protein has a longer N terminus, and both proteins contain multiple potential sites for phosphorylation and arginine methylation. Northern blot analysis showed that both transcripts were expressed in all tissues examined, although the amounts and ratios of the transcripts varied in different tissues. Three JKTBP transcripts greater than 2.8 kb were expressed in pancreas, spleen, and thymus. Western blot analysis of myeloid leukemia cells showed proteins of 38 and 53 kD. Tsuchiya et al. (1998) determined that recombinant HNRPDL interacted with both the double- and single- stranded forms of JKT41, an oligodeoxynucleotide corresponding to the cis- acting element in intron 9 of the MPO gene. Recombinant HNRPDL also interacted with poly(G) and poly(A), but not with poly(U) or poly(C). Transient expression of HNRPDL repressed expression of reporter genes located downstream of the intron 9 element of JKT41 or the intron 7 element of FERE27, another oligodeoxynucleotide corresponding to MPO.

[8252]

[8253] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[8254] Kamei, D.; Tsuchiya, N.; Yamazaki, M.; Meguro, H.; Yamada, M. : Two forms of expression and genomic structure of the human heterogeneous nuclear ribonucleoprotein D- like JKTBP gene (HNRPDL). Gene 228: 13- 22, 1999. ; and

[8255] Tsuchiya, N.; Kamei, D.; Takano, A.; Matsui, T.; Yamada, M. : Cloning and characterization of a cDNA encoding a novel heterogeneous nuclear ribonucleoprotein- like protein and its expressio.

[8256] Further studies establishing the function and utilities of HNRPDL are found in John Hopkins OMIM database record ID 607137, and in cited publications listed in Table 5, which are hereby incorporated by reference.Homeo box a4 (HOXA4, Accession NP_002132.2) is another GAM63 target gene, herein designated TARGET GENE. HOXA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXA4 BINDING SITE, designated SEQ ID:3176, to the nu-

cleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8257] Another function of GAM63 is therefore inhibition of Homeo box a4 (HOXA4, Accession NP_002132.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA4.

[8258] HPS6 (Accession NP_079023.1) is another GAM63 target gene, herein designated TARGET GENE. HPS6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HPS6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS6 BINDING SITE, designated SEQ ID:15251, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8259] Another function of GAM63 is therefore inhibition of HPS6 (Accession NP_079023.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS6.

[8260] HSN44A4A (Accession NP_056187.1) is another GAM63 target gene, herein designated TARGET GENE. HSN44A4A

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSN44A4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSN44A4A BINDING SITE, designated SEQ ID:15821, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8261] Another function of GAM63 is therefore inhibition of HSN44A4A (Accession NP_056187.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSN44A4A.

[8262] HSPC065 (Accession NP_054876.2) is another GAM63 target gene, herein designated TARGET GENE. HSPC065 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC065, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:4438, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8263] Another function of GAM63 is therefore inhibition of HSPC065 (Accession NP_054876.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065.

[8264] Immune associated nucleotide 4 like 1 (mouse) (IAN4L1, Accession NP_060854.2) is another GAM63 target gene, herein designated TARGET GENE. IAN4L1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAN4L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IAN4L1 BINDING SITE, designated SEQ ID:4785, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8265] Another function of GAM63 is therefore inhibition of Immune associated nucleotide 4 like 1 (mouse) (IAN4L1, Accession NP_060854.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IAN4L1.

[8266] Isocitrate dehydrogenase 3 (nad+) gamma (IDH3G, Accession NP_777358.1) is another GAM63 target gene, herein designated TARGET GENE. IDH3G BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IDH3G, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IDH3G BINDING SITE, designated SEQ ID:7580, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8267] Another function of GAM63 is therefore inhibition of Isocitrate dehydrogenase 3 (nad+) gamma (IDH3G, Accession NP_777358.1), a gene which decarboxylates isocitrate into alpha- ketoglutarate and therefore may be associated with Bilateral periventricular nodular heterotopia. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Bilateral periventricular nodular heterotopia, and of other diseases and clinical conditions associated with IDH3G.

[8268] The function of IDH3G has been established by previous studies. Brenner et al. (1997) presented the entire genomic sequence, as well as the cDNA sequence, of the human gene encoding the gamma subunit of the NAD(+)-dependent isocitrate dehydrogenase (IDH- gamma). The gene, symbolized IDH3G, is located in the region Xq28,

approximately 70 kb telomeric to the adrenoleukodystrophy locus (ALD; 300100) and adjacent to the TRAP- delta gene (OMIM Ref. No. 300090), which they also cloned. The sequences of the transcripts of IDH- gamma and TRAP- delta were obtained by searching the EST database with genomic data. Identified ESTs were completely sequenced and assembled to cDNAs comprising the entire coding region. For IDH- gamma, several EST clones indicated differential splicing. The 2 genes are arranged in a compact head- to- head manner. The nontranscribed intergenic region comprises only 133 bp and is embedded in a CpG island. Brenner et al. (1997) concluded that the CpG island functions as a bidirectional promoter to initiate the transcription of both functionally unrelated genes with quite distinct expression patterns. Brenner et al. (1997) showed that in both rat and mouse, this region of the genome is similarly compact and comprises less than 249 bp in rat and not more than 164 bp in mouse. In both cases this intergenic region is embedded in a CpG island and is highly conserved, with nucleotide identity values ranging from 70.1% between human and rat to 92.6% between mouse and rat. In a male patient with periventricular heterotopia (OMIM Ref. No. 300049) and a large duplication

of Xq28 reported by Fink et al. (1997), Fox et al. (1998) found that the centromeric boundary of the duplicated segment of Xq28 was base 3377 of the 3,395 bases of intron 1 of the IDH3G gene, approximately 600 kb distal to DXS15.

[8269]

[8270] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8271] Fink, J. M.; Dobyns, W. B.; Guerrini, R.; Hirsch, B. A. : Identification of a duplication of Xq28 associated with bilateral periventricular nodular heterotopia. Am. J. Hum. Genet. 61: 379- 387, 1997. ; and

[8272] Fox, J. W.; Lamperti, E. D.; Eksioglu, Y. Z.; Hong, S. E.; Feng, Y.; Graham, D. A.; Scheffer, I. E.; Dobyns, W. B.; Hirsch, B. A.; Radtke, R. A.; Berkovic, S. F.; Huttenlocher, P. R.; Wa.

[8273] Further studies establishing the function and utilities of IDH3G are found in John Hopkins OMIM database record ID 300089, and in cited publications listed in Table 5, which are hereby incorporated by reference.Immunoglobulin superfamily, member 9 (IGSF9, Accession NP_065840.1) is another GAM63 target gene,

herein designated TARGET GENE. IGSF9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IGSF9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGSF9 BINDING SITE, designated SEQ ID:2016, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8274] Another function of GAM63 is therefore inhibition of Immunoglobulin superfamily, member 9 (IGSF9, Accession NP_065840.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGSF9.

[8275] Interleukin 17b (IL17B, Accession NP_055258.1) is another GAM63 target gene, herein designated TARGET GENE. IL17B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL17B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL17B BINDING SITE, designated SEQ ID:5717, to the nucleotide sequence of GAM63 RNA, herein designated GAM

RNA, also designated SEQ ID:348.

[8276] Another function of GAM63 is therefore inhibition of Interleukin 17b (IL17B, Accession NP_055258.1), a gene which may play an important role in the initiation or maintenance of the proinflammatory response. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL17B.

[8277] The function of IL17B has been established by previous studies. Interleukin- 17 (IL17; 603149) is a T cell- derived cytokine that may play an important role in the initiation or maintenance of the proinflammatory response. Whereas expression of IL17 is restricted to activated T cells, the IL17 receptor (IL17R; 605461) has been shown to be widely expressed, a finding consistent with the pleiotropic activities of IL17. Li et al. (2000) cloned and expressed 2 novel human cytokines, IL17B and IL17C (OMIM Ref. No. 604628), that are related to IL17 (approximately 27% amino acid identity). Northern blot analysis detected an 800- bp IL17B mRNA in adult pancreas, small intestine, and stomach, whereas IL17C mRNA was not detected in several adult tissues. No expression of IL17B or IL17C mRNA was found in activated T cells. The authors found

that IL17B and IL17C differ from IL17 in their patterns of expression and biologic activities. These findings, coupled with the lack of interaction with the known IL17 receptor, suggested an expanded role for the IL17 family in the proinflammatory immune response Shi et al. (2000) cloned a cDNA encoding IL17B, which they initially designated IL20. The deduced 184- amino acid protein, 88% identical to the mouse sequence, has a 20- amino acid leader sequence, 1 potential N- glycosylation site, and 8 cysteine residues. Northern blot analysis detected a 1.0-kb transcript in spinal cord, testis, and small intestine, with less pronounced expression in prostate, colon mucosal lining, and ovary. SDS- PAGE analysis determined that IL17B is expressed as 23-, 22-, and 18- kD proteins under reducing conditions. Size- exclusion analysis suggested that IL17B is a nondisulfide- linked dimer. BIAcore, flow cytometric, and Western blot analyses determined that IL17B binds with high affinity to IL17BR (OMIM Ref. No. 605458) but only poorly to IL17R. Analysis of cultured cells showed that IL17B, in contrast to IL17, does not activate nuclear factor kappa- B (NFKB; OMIM Ref. No. 164011) or induce the production of cytokine message or protein

[8278]

[8279] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8280] Li, H.; Chen, J.; Huang, A.; Stinson, J.; Heldens, S.; Foster, J.; Dowd, P.; Gurney, A. L.; Wood, W. I. : Cloning and characterization of IL- 17B and IL- 17C, two new members of the IL- 17 cytokine family. Proc. Nat. Acad. Sci. 97: 773-778, 2000. ; and

[8281] Shi, Y.; Ullrich, S. J.; Zhang, J.; Connolly, K.; Grzegorzewski, K. J.; Barber, M. C.; Wang, W.; Wathen, K.; Hodge, V.; Fisher, C. L.; Olsen, H.; Ruben, S. M.; Knyazev, I.; Cho, Y. H.;.

[8282] Further studies establishing the function and utilities of IL17B are found in John Hopkins OMIM database record ID 604627, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 2 receptor, gamma (severe combined immunodeficiency) (IL2RG, Accession NP_000197.1) is another GAM63 target gene, herein designated TARGET GENE. IL2RG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL2RG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL2RG BINDING SITE, designated SEQ ID:3947, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8283] Another function of GAM63 is therefore inhibition of Interleukin 2 receptor, gamma (severe combined immunodeficiency) (IL2RG, Accession NP_000197.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RG.

[8284] Interleukin enhancer binding factor 3, 90kda (ILF3, Accession NP_036350.2) is another GAM63 target gene, herein designated TARGET GENE. ILF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ILF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ILF3 BINDING SITE, designated SEQ ID:6170, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8285] Another function of GAM63 is therefore inhibition of In-

terleukin enhancer binding factor 3, 90kda (ILF3, Accession NP_036350.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILF3.

[8286] Interferon regulatory factor 2 (IRF2, Accession NP_002190.1) is another GAM63 target gene, herein designated TARGET GENE. IRF2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IRF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRF2 BINDING SITE, designated SEQ ID:17355, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8287] Another function of GAM63 is therefore inhibition of Interferon regulatory factor 2 (IRF2, Accession NP_002190.1), a gene which is a transcriptional activator of type I interferon and interferon- inducible genes. and therefore may be associated with Atopic dermatitis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Atopic dermatitis, and of other diseases and clinical conditions associated with IRF2.

[8288] The function of IRF2 has been established by previous

studies. Interferon regulatory factor- 1 (IRF1; 147575), a transcriptional activator, and IRF2, its antagonistic repressor, are regulators of type I interferon and interferon- inducible genes. The IRF1 gene is itself interferon- inducible and hence may be one of the target genes critical for interferon action. Harada et al. (1993) found that when the IRF2 gene was overexpressed in NIH 3T3 cells, the cells became transformed and displayed enhanced tumorigenicity in nude mice. This transformed phenotype was reversed by concomitant expression of the IRF1 gene. Thus, restrained cell growth depends on a balance between these 2 mutually antagonistic transcription factors Nishio et al. (2001) screened for mutations in the 5-prime flanking and coding regions of IRF2 in patients with atopic dermatitis (see OMIM Ref. No. 603165). They found 5 novel variants and conducted a transmission disequilibrium test in families identified through patients with atopic dermatitis. The data suggested that the IRF2 gene may play a role in the development of atopic dermatitis in Japanese Ko et al. (2002) noted that Irf1 - /- mice are deficient in Inos (OMIM Ref. No. 163730), Il12b (OMIM Ref. No. 161561), Cd8- positive T cells, and natural killer (NK) cells, whereas Irf2 - /- mice are deficient in NK cells and

have dysregulated Il12b induction. Icsbp (OMIM Ref. No. 601565) - /- mice are deficient in Il12b, Irf2, and reactive oxygen intermediates (ROIs). All 3 are inducible by gamma- interferon (Ifng; 147570) and have varying susceptibility to different intracellular bacterial and protozoan pathogens. Ko et al. (2002) determined that Irf1 - /- mice are highly susceptible to fatal liver damage from Brucella abortus, the causative agent of brucellosis, which manifests as arthritis, endocarditis, and meningitis in humans. In contrast, Irf2 - /- mice are highly resistant to Brucella, whereas Icsbp - /- mice maintain a plateau of infection similar to that seen in Il12b - /- mice. The authors concluded that IL12, reactive nitrogen intermediates, and ROIs are probably crucial immune components in resistance to Brucella infection

[8289] Animal model experiments lend further support to the function of IRF2. Hida et al. (2000) observed that Irf2 - /- mice exhibited progressive cutaneous inflammation accompanied by hair loss and ulcer formation. Histopathologic analysis demonstrated epidermal thickening with proliferating keratinocytes expressing Icam1/Cd54 (OMIM Ref. No. 147840), features similar to those found in psoriasis. In addition, however, there was a disorganized mus-

cle layer and prominent fibrosis. In the basal dermis, infiltrating Cd8 (see OMIM Ref. No. 186910)- positive rather than Cd4 (OMIM Ref. No. 186940)- positive T cells were involved in the development of disease. In vitro analysis showed that the Cd8 T cells exhibited prolonged activation and proliferation with high expression of Cd44 (OMIM Ref. No. 107269) and Ly6c. RT- PCR and Northern blot analysis detected spontaneous expression of Ifna (OMIM Ref. No. 147660) and Ifnb (OMIM Ref. No. 147640), as well as overexpression of IFN- inducible genes, i.e., Oas (see OMIM Ref. No. 603351), Irf7 (OMIM Ref. No. 605047), Ip10 (SCYB10; 147310), and Mig (SCYB9; 601704), in the Irf2 - /- mice. Inactivation of the Ifna/Ifnb pathways by mutating Ifnar1 (OMIM Ref. No. 107450) or Irf9 resulted in the absence of skin disease in Irf2 - /- mice.

[8290] It is appreciated that the abovementioned animal model for IRF2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8291] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8292] Ko, J.; Gendron- Fitzpatrick, A.; Splitter, G. A. : Suscepti-

bility of IFN regulatory factor- 1 and IFN consensus sequence binding protein- deficient mice to brucellosis. J. Immun. 168: 2433- 2440, 2002. ; and

[8293] Nishio, Y.; Noguchi, E.; Ito, S.; Ichikawa, E.; Umebayashi, Y.; Otsuka, F.; Arinami, T. : Mutation and association analysis of the interferon regulatory factor 2 gene (IRF2) with atopic.

[8294] Further studies establishing the function and utilities of IRF2 are found in John Hopkins OMIM database record ID 147576, and in cited publications listed in Table 5, which are hereby incorporated by reference.Isl2 transcription factor, lim/homeodomain, (islet-2) (ISL2, Accession NP_665804.1) is another GAM63 target gene, herein designated TARGET GENE. ISL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ISL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ISL2 BINDING SITE, designated SEQ ID:3035, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8295] Another function of GAM63 is therefore inhibition of Isl2 transcription factor, lim/homeodomain, (islet-2) (ISL2,

Accession NP_665804.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL2.

[8296] Inter-alpha (globulin) inhibitor, h1 polypeptide (ITIH1, Accession NP_002206.1) is another GAM63 target gene, herein designated TARGET GENE. ITIH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITIH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITIH1 BINDING SITE, designated SEQ ID:18461, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8297] Another function of GAM63 is therefore inhibition of Inter-alpha (globulin) inhibitor, h1 polypeptide (ITIH1, Accession NP_002206.1), a gene which may act as a carrier of hyaluronan in serum or as a binding protein between hyaluronan and other matrix protein. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITIH1.

[8298] The function of ITIH1 has been established by previous studies. Inter- alpha- trypsin inhibitor (IATI) is a serine

protease inhibitor with an overall molecular weight of 180,000 which is found in human plasma. Salier et al. (1987) reported that IATI is a multifunctional protein comprised of polypeptide chains that are synthesized in the liver by 2 distinct mRNA species: a heavy chain with a molecular weight of 95,000 and a light chain (ITIL; 176870) with a molecular weight of 40,000. Salier et al. (1987) characterized cDNAs for the H chain of IATI. Di- arra- Mehrpour et al. (1989) showed that human poly(A)- rich RNAs hybrid- selected with various heavy- chain- en- coding cDNA clones translate 3 different heavy chains, designated H1 (M(r) 92,000), H2 (ITIH2; 146640; M(r) 98,000), and H3 (ITIH3; 146650; M(r) 107,000). Two pre- viously characterized heavy- chain cDNA clones were found to correspond to H1 and H2 chains. The deduced amino acid sequence of the H3 chain was found to be highly similar to those of the H1 (54%) and H2 (44%) chains. Diarra- Mehrpour et al. (1992) used a PCR- based cloning approach and cDNA library screening to isolate the full- length cDNA H1. Diarra- Mehrpour et al. (1994) demonstrated that the ITIH1 and ITIH3 genes are arranged in tandem, 2,721 bp apart. Diarra- Mehrpour et al. (1998) reported that the ITIH4 (OMIM Ref. No. 600564) gene is

located just downstream of the last ITIH3 exon, and is transcribed in the opposite orientation. Bost et al. (1993) determined that the ITIH1 gene contains 22 exons and spans 14 kb. Northern blot analysis indicated that the 2.9- kb ITIH1 mRNA is expressed only in liver. The authors found evidence for alternative splicing of at least 1 exon of the ITIH1 gene. In situ hybridization by Diarra-Mehrpour et al. (1989) showed that the H1 and H3 genes are located in the 3p21.2- p21.1 region, whereas the H2 gene resides at 10p15

[8299]

[8300] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8301] Diarra- Mehrpour, M.; Sarafan, N.; Bourguignon, J.; Bonnet, F.; Bost, F.; Martin, J.- P. : Human inter- alpha- trypsin inhibitor heavy chain H3 gene: genomic organization, promoter analysis, and gene linkage. J. Biol. Chem. 273: 26809- 26819, 1998. ; and

[8302] Ding, M.; Umetsu, K.; Yuasa, I.; Sato, M.; Harada, A.; Suzuki, T. : Molecular basis of inter- alpha- trypsin inhibitor heavy chain H1 (ITIH1) polymorphism. Hum. Genet. 95: 435- 436, 1995.

[8303] Further studies establishing the function and utilities of ITIH1 are found in John Hopkins OMIM database record ID 147270, and in cited publications listed in Table 5, which are hereby incorporated by reference.Inositol 1,4,5-trisphosphate 3-kinase b (ITPKB, Accession NP_002212.1) is another GAM63 target gene, herein designated TARGET GENE. ITPKB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITPKB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:14689, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8304] Another function of GAM63 is therefore inhibition of Inositol 1,4,5-trisphosphate 3-kinase b (ITPKB, Accession NP_002212.1), a gene which is a type B inositol 1,4,5-triphosphate 3 kinase. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB.

[8305] The function of ITPKB has been established by previous studies. Takazawa et al. (1991) isolated a second inositol 1,4,5- trisphosphate 3- kinase cDNA from a human hip-

pocampus cDNA library. Sequencing yielded an open reading frame encoding a 472- amino acid protein with a calculated relative mass of 53,451. The C- terminal part of this enzyme, referred to as 3- kinase- B, namely, residues 187- 462, was 68% identical to 3- kinase- A (OMIM Ref. No. 147521) in amino acid sequence. By in situ hybridization, Erneux et al. (1992) mapped the ITPKB gene to 1q41- q43.

[8306]

[8307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8308] Erneux, C.; Roeckel, N.; Takazawa, K.; Mailleux, P.; Vassart, G.; Mattei, M. G. : Localization of the genes for human inositol 1,4,5- trisphosphate 3- kinase A (ITPKA) and B (ITPKB) to chromosome regions 15q14- q21 and 1q41- q43, respectively, by in situ hybridization. Genomics 14: 546- 547, 1992. ; and

[8309] Takazawa, K.; Perret, J.; Dumont, J. E.; Erneux, C. : Molecular cloning and expression of a new putative inositol 1,4,5- trisphosphate 3- kinase isoenzyme. Biochem. J. 278: 883- 886, 1991.

[8310] Further studies establishing the function and utilities of

ITPKB are found in John Hopkins OMIM database record ID 147522, and in cited publications listed in Table 5, which are hereby incorporated by reference.Jumping translocation breakpoint (JTB, Accession NP_006685.1) is another GAM63 target gene, herein designated TARGET GENE. JTB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JTB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JTB BINDING SITE, designated SEQ ID:4192, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8311] Another function of GAM63 is therefore inhibition of Jumping translocation breakpoint (JTB, Accession NP_006685.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JTB.

[8312] K5B (Accession NP_775487.1) is another GAM63 target gene, herein designated TARGET GENE. K5B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by K5B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of K5B BINDING SITE, designated SEQ ID:9971, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8313] Another function of GAM63 is therefore inhibition of K5B (Accession NP_775487.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with K5B.

[8314] Potassium voltage-gated channel, shaker-related subfamily, member 6 (KCNA6, Accession NP_002226.1) is another GAM63 target gene, herein designated TARGET GENE. KCNA6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNA6 BINDING SITE, designated SEQ ID:14965, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8315] Another function of GAM63 is therefore inhibition of Potassium voltage-gated channel, shaker-related subfamily, member 6 (KCNA6, Accession NP_002226.1), a gene

which mediates the voltage- dependent potassium ion permeability of excitable membranes. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA6.

[8316] The function of KCNA6 has been established by previous studies. By screening a human fetal cDNA library with a rat RCK3 potassium channel cDNA, Grupe et al. (1990) isolated cDNAs encoding a protein that they designated HBK2 (human brain potassium channel- 2). The authors also cloned cDNAs corresponding to the rat homolog, RCK2. The predicted 529- amino acid HBK2 protein shares 94% identity with RCK2. HBK2 and RCK2 have the characteristic structure of voltage- gated ionic channels, with 6 potential membrane- spanning segments. When expressed in Xenopus oocytes, the HBK2/RCK2 channels exhibited the functional characteristics of a delayed- rectifier channel that acts especially in the more positive membrane voltage range. The functional and pharmacologic properties of HBK2/RCK2 potassium channels were distinct from those of previously characterized channels. Grupe et al. (1990) determined that the HBK2 gene did not contain introns. Using interspecific backcrosses between

Mus musculus and Mus spretus, Klocke et al. (1993) mapped the mouse gene encoding the Kv1.6 potassium voltage- gated channel, Kcna6, to chromosome 6 in a cluster with Kcna1, Kcna5 (OMIM Ref. No. 176267), and the homolog of human TPI1 (OMIM Ref. No. 190450). Since human TPI1 is located on band 12p13, Klocke et al. (1993) predicted that the human KCNA6 gene is located on 12p near other genes of the Shaker- related subfamily, KCNA1 and KCNA5. Albrecht et al. (1995) determined that a 300- kb cluster on chromosome 12p13 contains the human KCNA6, KCNA1, and KCNA5 genes arranged in tandem

[8317]

[8318] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8319] Albrecht, B.; Weber, K.; Pongs, O. : Characterization of a voltage- activated K- channel gene cluster on human chromosome 12p13. Receptors Channels 3: 213- 220, 1995. ; and

member of the R.

[8321] Further studies establishing the function and utilities of KCNA6 are found in John Hopkins OMIM database record ID 176257, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium inwardly-rectifying channel, subfamily j, member 1 (KCNJ1, Accession NP_722450.1) is another GAM63 target gene, herein designated TARGET GENE. KCNJ1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KCNJ1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ1 BINDING SITE, designated SEQ ID:16832, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8322] Another function of GAM63 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 1 (KCNJ1, Accession NP_722450.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ1.

[8323] Potassium inwardly-rectifying channel, subfamily j, mem-

ber 1 (KCNJ1, Accession NP_722451.1) is another GAM63 target gene, herein designated TARGET GENE. KCNJ1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KCNJ1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ1 BINDING SITE, designated SEQ ID:16832, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8324] Another function of GAM63 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 1 (KCNJ1, Accession NP_722451.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ1.

[8325] Potassium channel, subfamily t, member 1 (KCNT1, Accession XP_029962.2) is another GAM63 target gene, herein designated TARGET GENE. KCNT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:10138, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8326] Another function of GAM63 is therefore inhibition of Potassium channel, subfamily t, member 1 (KCNT1, Accession XP_029962.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1.

[8327] KIAA0063 (Accession NP_055691.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:17332, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8328] Another function of GAM63 is therefore inhibition of KIAA0063 (Accession NP_055691.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0063.

[8329] KIAA0217 (Accession XP_040265.4) is another GAM63 target gene, herein designated TARGET GENE. KIAA0217 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0217, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:3254, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8330] Another function of GAM63 is therefore inhibition of KIAA0217 (Accession XP_040265.4) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217.

[8331] KIAA0227 (Accession XP_027236.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0227 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0227, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA0227 BINDING SITE, designated SEQ ID:16188, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8332] Another function of GAM63 is therefore inhibition of KIAA0227 (Accession XP_027236.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227.

[8333] KIAA0232 (Accession XP_291106.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:10118, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8334] Another function of GAM63 is therefore inhibition of KIAA0232 (Accession XP_291106.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232.

[8335] KIAA0256 (Accession XP_034905.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0256 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0256, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0256 BINDING SITE, designated SEQ ID:16597, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8336] Another function of GAM63 is therefore inhibition of KIAA0256 (Accession XP_034905.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0256.

[8337] KIAA0258 (Accession NP_055600.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0258 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:15208, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8338] Another function of GAM63 is therefore inhibition of KIAA0258 (Accession NP_055600.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258.

[8339] KIAA0296 (Accession NP_055514.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0296 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0296, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:14490, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8340] Another function of GAM63 is therefore inhibition of KIAA0296 (Accession NP_055514.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296.

[8341] KIAA0415 (Accession XP_166527.2) is another GAM63

target gene, herein designated TARGET GENE. KIAA0415 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0415, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0415 BINDING SITE, designated SEQ ID:15657, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8342] Another function of GAM63 is therefore inhibition of KIAA0415 (Accession XP_166527.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0415.

[8343] KIAA0427 (Accession NP_055587.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0427 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0427, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:15166, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[8344] Another function of GAM63 is therefore inhibition of KIAA0427 (Accession NP_055587.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427.

[8345] KIAA0450 (Accession NP_055453.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0450 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:12861, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8346] Another function of GAM63 is therefore inhibition of KIAA0450 (Accession NP_055453.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450.

[8347] KIAA0472 (Accession XP_290898.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0472

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0472, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:3805, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8348] Another function of GAM63 is therefore inhibition of KIAA0472 (Accession XP_290898.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472.

[8349] KIAA0475 (Accession NP_055679.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0475 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:19144, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8350] Another function of GAM63 is therefore inhibition of KIAA0475 (Accession NP_055679.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475.

[8351] KIAA0545 (Accession XP_032278.3) is another GAM63 target gene, herein designated TARGET GENE. KIAA0545 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0545, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0545 BINDING SITE, designated SEQ ID:6128, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8352] Another function of GAM63 is therefore inhibition of KIAA0545 (Accession XP_032278.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0545.

[8353] KIAA0599 (Accession XP_085127.6) is another GAM63 target gene, herein designated TARGET GENE. KIAA0599 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by KIAA0599, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:13331, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8354] Another function of GAM63 is therefore inhibition of KIAA0599 (Accession XP_085127.6) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599.

[8355] KIAA0669 (Accession NP_055594.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0669 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0669 BINDING SITE, designated SEQ ID:16391, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8356] Another function of GAM63 is therefore inhibition of

KIAA0669 (Accession NP_055594.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0669.

[8357] KIAA0676 (Accession NP_055858.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0676 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0676, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:11139, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8358] Another function of GAM63 is therefore inhibition of KIAA0676 (Accession NP_055858.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676.

[8359] KIAA0710 (Accession NP_055686.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0710 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0710, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0710 BINDING SITE, designated SEQ ID:12253, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8360] Another function of GAM63 is therefore inhibition of KIAA0710 (Accession NP_055686.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0710.

[8361] KIAA0767 (Accession XP_027105.2) is another GAM63 target gene, herein designated TARGET GENE. KIAA0767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0767 BINDING SITE, designated SEQ ID:16026, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8362] Another function of GAM63 is therefore inhibition of KIAA0767 (Accession XP_027105.2) . Accordingly, utilities

of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0767.

[8363] KIAA0773 (Accession NP_055505.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0773 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0773, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0773 BINDING SITE, designated SEQ ID:13455, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8364] Another function of GAM63 is therefore inhibition of KIAA0773 (Accession NP_055505.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0773.

[8365] KIAA0825 (Accession XP_027906.5) is another GAM63 target gene, herein designated TARGET GENE. KIAA0825 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0825, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:11299, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8366] Another function of GAM63 is therefore inhibition of KIAA0825 (Accession XP_027906.5) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825.

[8367] KIAA0889 (Accession NP_689470.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0889 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:1863, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8368] Another function of GAM63 is therefore inhibition of KIAA0889 (Accession NP_689470.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0889.

[8369] KIAA0889 (Accession NP_056192.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA0889 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:1863, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8370] Another function of GAM63 is therefore inhibition of KIAA0889 (Accession NP_056192.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889.

[8371] KIAA1111 (Accession XP_171233.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1111 BINDING SITE, designated SEQ ID:6397, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8372] Another function of GAM63 is therefore inhibition of KIAA1111 (Accession XP_171233.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1111.

[8373] KIAA1115 (Accession NP_055746.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1115 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1115 BINDING SITE, designated SEQ ID:17435, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8374] Another function of GAM63 is therefore inhibition of KIAA1115 (Accession NP_055746.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1115.

[8375] KIAA1198 (Accession NP_065765.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1198 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:19022, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8376] Another function of GAM63 is therefore inhibition of KIAA1198 (Accession NP_065765.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198.

[8377] KIAA1203 (Accession XP_049683.4) is another GAM63 target gene, herein designated TARGET GENE. KIAA1203 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1203, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1203 BINDING SITE, designated SEQ ID:12583, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8378] Another function of GAM63 is therefore inhibition of KIAA1203 (Accession XP_049683.4) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203.

[8379] KIAA1210 (Accession XP_172801.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1210 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1210, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE, designated SEQ ID:6250, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8380] Another function of GAM63 is therefore inhibition of KIAA1210 (Accession XP_172801.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210.

[8381] KIAA1318 (Accession NP_065820.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1318 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1318, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1318 BINDING SITE, designated SEQ ID:5129, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8382] Another function of GAM63 is therefore inhibition of KIAA1318 (Accession NP_065820.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1318.

[8383] KIAA1396 (Accession XP_032054.2) is another GAM63 target gene, herein designated TARGET GENE. KIAA1396 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1396, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1396 BINDING SITE, designated SEQ ID:5415, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8384] Another function of GAM63 is therefore inhibition of KIAA1396 (Accession XP_032054.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1396.

[8385] KIAA1416 (Accession XP_098762.3) is another GAM63 target gene, herein designated TARGET GENE. KIAA1416 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:2332, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8386] Another function of GAM63 is therefore inhibition of KIAA1416 (Accession XP_098762.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416.

[8387] KIAA1493 (Accession XP_034415.1) is another GAM63

target gene, herein designated TARGET GENE. KIAA1493 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:18298, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8388] Another function of GAM63 is therefore inhibition of KIAA1493 (Accession XP_034415.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493.

[8389] KIAA1511 (Accession XP_046581.5) is another GAM63 target gene, herein designated TARGET GENE. KIAA1511 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1511, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1511 BINDING SITE, designated SEQ ID:2587, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[8390] Another function of GAM63 is therefore inhibition of KIAA1511 (Accession XP_046581.5) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1511.

[8391] KIAA1530 (Accession XP_042661.5) is another GAM63 target gene, herein designated TARGET GENE. KIAA1530 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1530, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:8145, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8392] Another function of GAM63 is therefore inhibition of KIAA1530 (Accession XP_042661.5) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530.

[8393] KIAA1656 (Accession XP_038022.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1656

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1656, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:15785, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8394] Another function of GAM63 is therefore inhibition of KIAA1656 (Accession XP_038022.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656.

[8395] KIAA1674 (Accession XP_290462.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1674 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1674, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:8923, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8396] Another function of GAM63 is therefore inhibition of KIAA1674 (Accession XP_290462.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674.

[8397] KIAA1753 (Accession XP_036115.3) is another GAM63 target gene, herein designated TARGET GENE. KIAA1753 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1753, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1753 BINDING SITE, designated SEQ ID:6431, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8398] Another function of GAM63 is therefore inhibition of KIAA1753 (Accession XP_036115.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1753.

[8399] KIAA1805 (Accession NP_115810.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1805 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1805 BINDING SITE, designated SEQ ID:17427, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8400] Another function of GAM63 is therefore inhibition of KIAA1805 (Accession NP_115810.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1805.

[8401] KIAA1920 (Accession XP_085210.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA1920 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1920 BINDING SITE, designated SEQ ID:17296, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8402] Another function of GAM63 is therefore inhibition of

KIAA1920 (Accession XP_085210.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1920.

[8403] KIAA2020 (Accession XP_290463.1) is another GAM63 target gene, herein designated TARGET GENE. KIAA2020 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA2020, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2020 BINDING SITE, designated SEQ ID:16952, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8404] Another function of GAM63 is therefore inhibition of KIAA2020 (Accession XP_290463.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2020.

[8405] Kinesin family member 3c (KIF3C, Accession NP_002245.2) is another GAM63 target gene, herein designated TARGET GENE. KIF3C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by KIF3C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF3C BINDING SITE, designated SEQ ID:10471, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8406] Another function of GAM63 is therefore inhibition of Kinesin family member 3c (KIF3C, Accession NP_002245.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3C.

[8407] Kin of irre like (drosophila) (KIRREL, Accession NP_060710.1) is another GAM63 target gene, herein designated TARGET GENE. KIRREL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIRREL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIRREL BINDING SITE, designated SEQ ID:6373, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8408] Another function of GAM63 is therefore inhibition of Kin of irre like (drosophila) (KIRREL, Accession NP_060710.1) .

Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIRREL.

[8409] Kruppel-like factor 2 (lung) (KLF2, Accession NP_057354.1) is another GAM63 target gene, herein designated TARGET GENE. KLF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KLF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLF2 BINDING SITE, designated SEQ ID:446, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8410] Another function of GAM63 is therefore inhibition of Kruppel-like factor 2 (lung) (KLF2, Accession NP_057354.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF2.

[8411] Karyopherin alpha 1 (importin alpha 5) (KPNA1, Accession NP_002255.1) is another GAM63 target gene, herein designated TARGET GENE. KPNA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KPNA1, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNA1 BINDING SITE, designated SEQ ID:8053, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8412] Another function of GAM63 is therefore inhibition of Karyopherin alpha 1 (importin alpha 5) (KPNA1, Accession NP_002255.1), a gene which promotes docking of import substrates to the nuclear pore complex. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA1.

[8413] The function of KPNA1 has been established by previous studies. Cortes et al. (1994) used the 2- hybrid protein interaction systems to isolate a protein that specifically interacts with RAG1 (OMIM Ref. No. 179615). The genes RAG1 and RAG2 (OMIM Ref. No. 179616) are able to activate V(D)J recombination when transfected into fibroblasts. Further, knockout mice for these 2 loci lack B and T cells. Several other ubiquitously expressed proteins are thought to be recruited in the recombination process. Among these are the genes affected in severe combined immune deficiency (e.g., OMIM Ref. No. also 600899) and

genes involved in ds- DNA break repair. The human cDNA identified by Cortes et al. (1994) encodes a 489- amino acid polypeptide that shows striking similarity to the yeast SRP1 protein, a mutant allele which can suppress a mutation of RNA polymerase I. The authors obtained human and mouse cDNA sequences which are 98% identical as proteins. When RAG1 and human SRP1 were cotransfected into 293T cells a stable complex of the 2 was observed. The authors speculated that because SRP1 appears to be bound to the nuclear envelope, the interaction with RAG1 may serve to localize that protein to the envelope as well. Conti et al. (1998) reported the crystal structure of a 50- kD fragment of the 60- kD yeast karyopherin alpha, in the absence and presence of a monopartite nuclear localization signal (NLS) peptide at 2.2- angstrom and 2.8- angstrom resolution, respectively. The structure showed a tandem array of 10 armadillo repeats, organized in a right- handed superhelix of helices. Binding of the NLS peptide occurred at 2 sites within a helical surface groove. The structure reveals the determinants of NLS specificity and suggested a model for the recognition of bipartite NLSs. By fluorescence in situ hybridization, Ayala- Madrigal et al. (2000) mapped the human KPNA1 gene to chro-

mosome 3q21.

[8414]

[8415] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8416] Ayala- Madrigal, M. L.; Doerr, S.; Ramirez- Duenas, M. L.; Hansmann, I. : Assignment of karyopherin alpha 1 (KPNA1) to human chromosome band 3q21 by in situ hybridization. Cytogenet. Cell Genet. 90: 58- 59, 2000. ; and

[8417] Conti, E.; Uy, M.; Leighton, L.; Blobel, G.; Kuriyan, J. : Crystallographic analysis of the recognition of a nuclear localization signal by the nuclear import factor karyopherin alpha.

[8418] Further studies establishing the function and utilities of KPNA1 are found in John Hopkins OMIM database record ID 600686, and in cited publications listed in Table 5, which are hereby incorporated by reference.Karyopherin (importin) beta 2 (KPNB2, Accession NP_694858.1) is another GAM63 target gene, herein designated TARGET GENE. KPNB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KPNB2, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNB2 BINDING SITE, designated SEQ ID:10216, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8419] Another function of GAM63 is therefore inhibition of Karyopherin (importin) beta 2 (KPNB2, Accession NP_694858.1), a gene which is involved in nuclear import of m9- containing proteins. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNB2.

[8420] The function of KPNB2 has been established by previous studies. Targeting of most nuclear proteins to the cell nucleus is initiated by interaction between the protein's nuclear localization signal (NLS) and the importin, or karyopherin, receptor complex. An importin heterodimer recognizes the NLS protein in the cytoplasm via its alpha subunit and, via its beta subunit, docks the complex to a subset of peptide repeat- containing proteins known as nucleoporins. See importin beta- 1 (KPNB1; 602738). Michael et al. (1995) determined that the C terminus of HNRPA1 (OMIM Ref. No. 164017) contains a 38- amino

acid domain, termed M9, that confers bidirectional transport across the nuclear envelope. Pollard et al. (1996) found that M9- mediated nuclear import occurs by a novel pathway independent of the importin- mediated NLS pathway. Using a yeast 2- hybrid system, they identified a HeLa cell cDNA encoding a protein that interacts with an M9- containing sequence. The predicted 890- amino acid protein was designated M9- interacting protein (MIP1), or transportin. Transportin contains 2 leucine zipper motifs and a 19- amino acid highly acidic domain, and has an estimated pI of 4.6. Pollard et al. (1996) demonstrated that transportin mediated the nuclear import of M9- bearing proteins. Bonifaci et al. (1997) isolated cDNAs encoding transportin, which they designated karyopherin beta-2, or KPNB2. They reported that the predicted protein sequence is 34% identical to that of the yeast beta- karyopherin Kap104p. Using overlay blots, Bonifaci et al. (1997) demonstrated that KPNB2 also functions as a docking factor that binds to peptide repeat- containing nucleoporins. In an assay using permeabilized HeLa cells, KPNB2 inhibited KPNB1- mediated import of an NLS- containing substrate and KPNB1 inhibited KPNB2- mediated import of recombinant HNRPA1. These results led Bonifaci et al.

(1997) to suggest that the distinct KPNB1- and KPNB2-mediated nuclear import pathways merge at least partially at the level of docking to nucleoporins. The International Radiation Hybrid Mapping Consortium mapped the KPNB2 gene to chromosome 5 (WI- 13973).

[8421]

[8422] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8424] Michael, W. M.; Choi, M.; Dreyfuss, G. : A nuclear export signal in hnRNP A1: a signal- mediated, temperature- dependent nuclear protein export pathway. Cell 83: 415-422, 1995.

[8425] Further studies establishing the function and utilities of KPNB2 are found in John Hopkins OMIM database record ID 602901, and in cited publications listed in Table 5, which are hereby incorporated by reference.Karyopherin (importin) beta 2 (KPNB2, Accession NP_002261.2) is another GAM63 target gene, herein designated TARGET

GENE. KPNB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KPNB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNB2 BINDING SITE, designated SEQ ID:10216, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8426] Another function of GAM63 is therefore inhibition of Karyopherin (importin) beta 2 (KPNB2, Accession NP_002261.2), a gene which is involved in nuclear import of m9- containing proteins. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNB2.

[8427] The function of KPNB2 has been established by previous studies. Targeting of most nuclear proteins to the cell nucleus is initiated by interaction between the protein's nuclear localization signal (NLS) and the importin, or karyopherin, receptor complex. An importin heterodimer recognizes the NLS protein in the cytoplasm via its alpha subunit and, via its beta subunit, docks the complex to a subset of peptide repeat- containing proteins known as

nucleoporins. See importin beta- 1 (KPNB1; 602738). Michael et al. (1995) determined that the C terminus of HNRPA1 (OMIM Ref. No. 164017) contains a 38- amino acid domain, termed M9, that confers bidirectional transport across the nuclear envelope. Pollard et al. (1996) found that M9- mediated nuclear import occurs by a novel pathway independent of the importin- mediated NLS pathway. Using a yeast 2- hybrid system, they identified a HeLa cell cDNA encoding a protein that interacts with an M9- containing sequence. The predicted 890- amino acid protein was designated M9- interacting protein (MIP1), or transportin. Transportin contains 2 leucine zipper motifs and a 19- amino acid highly acidic domain, and has an estimated pI of 4.6. Pollard et al. (1996) demonstrated that transportin mediated the nuclear import of M9- bearing proteins. Bonifaci et al. (1997) isolated cDNAs encoding transportin, which they designated karyopherin beta-2, or KPNB2. They reported that the predicted protein sequence is 34% identical to that of the yeast beta- karyopherin Kap104p. Using overlay blots, Bonifaci et al. (1997) demonstrated that KPNB2 also functions as a docking factor that binds to peptide repeat- containing nucleoporins. In an assay using permeabilized HeLa cells, KPNB2 inhib-

ited KPNB1- mediated import of an NLS- containing substrate and KPNB1 inhibited KPNB2- mediated import of recombinant HNRPA1. These results led Bonifaci et al. (1997) to suggest that the distinct KPNB1- and KPNB2-mediated nuclear import pathways merge at least partially at the level of docking to nucleoporins. The International Radiation Hybrid Mapping Consortium mapped the KPNB2 gene to chromosome 5 (WI- 13973).

[8428]

[8429] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8430] Bonifaci, N.; Moroianu, J.; Radu, A.; Blobel, G. : Karyopherin beta- 2 mediates nuclear import of a mRNA binding protein. Proc. Nat. Acad. Sci. 94: 5055- 5060, 1997. ; and

[8431] Michael, W. M.; Choi, M.; Dreyfuss, G. : A nuclear export signal in hnRNP A1: a signal- mediated, temperature- dependent nuclear protein export pathway. Cell 83: 415-422, 1995.

[8432] Further studies establishing the function and utilities of KPNB2 are found in John Hopkins OMIM database record ID 602901, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Keratin associated protein 1-5 (KRTAP1-5, Accession NP_114163.1) is another GAM63 target gene, herein designated TARGET GENE. KRTAP1-5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRTAP1-5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRTAP1-5 BINDING SITE, designated SEQ ID:20046, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8433] Another function of GAM63 is therefore inhibition of Keratin associated protein 1-5 (KRTAP1-5, Accession NP_114163.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP1-5.

[8434] Keratin associated protein 3-1 (KRTAP3-1, Accession NP_114164.1) is another GAM63 target gene, herein designated TARGET GENE. KRTAP3-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KRTAP3-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of KRTAP3-1 BINDING SITE, designated SEQ ID:6804, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8435] Another function of GAM63 is therefore inhibition of Keratin associated protein 3-1 (KRTAP3-1, Accession NP_114164.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP3-1.

[8436] Lactation elevated 1 (LACE1, Accession NP_660358.2) is another GAM63 target gene, herein designated TARGET GENE. LACE1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LACE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LACE1 BINDING SITE, designated SEQ ID:5643, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8437] Another function of GAM63 is therefore inhibition of Lactation elevated 1 (LACE1, Accession NP_660358.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with LACE1.

[8438] Laminin, beta 1 (LAMB1, Accession NP_002282.1) is another GAM63 target gene, herein designated TARGET GENE. LAMB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LAMB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAMB1 BINDING SITE, designated SEQ ID:12728, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8439] Another function of GAM63 is therefore inhibition of Laminin, beta 1 (LAMB1, Accession NP_002282.1), a gene which mediates the attachment, migration, and organization of cells into tissues. and therefore may be associated with Marfan syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Marfan syndrome, and of other diseases and clinical conditions associated with LAMB1.

[8440] The function of LAMB1 has been established by previous studies. The major components of basal laminae are the glycoproteins laminin and collagen IV, both of which are heterotrimers. Laminin is a cruciform protein trimer of

chains that when originally isolated from the extracellular matrix of tumor cells, were named A, B1, and B2, but were renamed alpha- 1, beta- 1, and gamma- 1, respectively (Burgeson et al., 1994). The laminin and collagen IV isoforms vary from one basal lamina to another and are members of multigene families. These gene families (like others, such as the globins and myosins) may provide a means of generating functional diversity within a common structural framework. Modi et al. (1987) mapped the LAMB1 locus to 7q31.1- q31.3 by Southern blot analysis of somatic cell hybrids and by in situ hybridization. On the other hand, by the same methods, Pikkarainen et al. (1987) placed LAMB1 in the 7q22 band. Jaye et al. (1987) regionalized LAMB1 to band 7q31 by somatic cell hybridization and in situ hybridization. Bonneau et al. (1991) described an infant with cutis laxa, emphysema, striking cardiac abnormalities and a diaphragmatic hernia leading to death at the age of 22 weeks. The infant had mild contractures at the elbows, hips, and knees, with bilateral hip dislocation. Arachnodactyly was striking. Chromosome studies showed a chromatid break at the junction of 7q31.3 and 7q32. Among 17 previously reported cases with the same syndrome, 1 was found to have a translo-

cation involving 7q31 (Huret et al., 1991). Bonneau et al. (1991) called the condition neonatal cutis laxa with marfanoid phenotype. The clinical features and the location of the chromosomal change prompted Bonneau et al. (1991) to study laminin, which, by use of anti- human laminin antiserum, was found to be absent from the basement membranes of capillaries and the dermal- epidermal junction. Fibronectin was also not detected in the skin sample. Laminin B1 (OMIM Ref. No. 150240) maps to the same region of 7q. Bonneau et al. (1991) pointed to reports of some 12 cases of neonatal 'Marfan syndrome' which might represent this same syndrome. These included the cases of Neimann et al. (1968), Hohn and Webb (1971), Lababidi and Monzon (1981), Buchanan and Wyatt (1985), Day and Burke (1986), and Gross et al. (1989). In a note added in proof, Bonneau et al. (1991) stated that studies of the case published by Neimann et al. (1968) showed deficiency of laminin in the basement membranes. Burgeson et al. (1994), a group of 14 leading researchers in the field of connective tissue proteins, adopted a new nomenclature for the laminins. They were numbered with arabic numerals in the order discovered. The previous A, B1, and B2 chains, and their isoforms, are

alpha, beta, and gamma, respectively, followed by an arabic numeral to identify the isoform. For example, the first laminin identified from the Engelbreth- Holm- Swarm tumor (EHS) was designated laminin- 1 with the chain composition alpha- 1/beta- 1/gamma- 1. The genes for these 3 chains are LAMA1 (OMIM Ref. No. 150320), LAMB1, and LAMC1 (OMIM Ref. No. 150290).

[8441]

[8442] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8444] Bonneau, D.; Huret, J. L.; Godeau, G.; Couet, D.; Putterman, M.; Tanzer, J.; Babin, P.; Larregue, M. : Recurrent ctb(7)(q31.3) and possible laminin involvement in a neonatal cutis laxa w.

[8445] Further studies establishing the function and utilities of LAMB1 are found in John Hopkins OMIM database record ID 150240, and in cited publications listed in Table 5,

which are hereby incorporated by reference.LCHN (Accession XP_098615.2) is another GAM63 target gene, herein designated TARGET GENE. LCHN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LCHN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LCHN BINDING SITE, designated SEQ ID:447, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8446] Another function of GAM63 is therefore inhibition of LCHN (Accession XP_098615.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCHN.

[8447] LEREPO4 (Accession NP_060941.1) is another GAM63 target gene, herein designated TARGET GENE. LEREPO4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LEREPO4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LEREPO4 BINDING SITE, designated SEQ ID:12248, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8448] Another function of GAM63 is therefore inhibition of LEREPO4 (Accession NP_060941.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEREPO4.

[8449] LOC112476 (Accession NP_660282.1) is another GAM63 target gene, herein designated TARGET GENE. LOC112476 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC112476, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC112476 BINDING SITE, designated SEQ ID:13020, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8450] Another function of GAM63 is therefore inhibition of LOC112476 (Accession NP_660282.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112476.

[8451] LOC112840 (Accession NP_542397.1) is another GAM63 target gene, herein designated TARGET GENE. LOC112840

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC112840, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC112840 BINDING SITE, designated SEQ ID:3419, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8452] Another function of GAM63 is therefore inhibition of LOC112840 (Accession NP_542397.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112840.

[8453] LOC118709 (Accession XP_058338.2) is another GAM63 target gene, herein designated TARGET GENE. LOC118709 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC118709, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118709 BINDING SITE, designated SEQ ID:10613, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8454] Another function of GAM63 is therefore inhibition of LOC118709 (Accession XP_058338.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118709.

[8455] LOC120376 (Accession XP_071712.3) is another GAM63 target gene, herein designated TARGET GENE. LOC120376 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC120376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC120376 BINDING SITE, designated SEQ ID:15763, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8456] Another function of GAM63 is therefore inhibition of LOC120376 (Accession XP_071712.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120376.

[8457] LOC122258 (Accession NP_660291.1) is another GAM63 target gene, herein designated TARGET GENE. LOC122258 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC122258, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC122258 BINDING SITE, designated SEQ ID:14397, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8458] Another function of GAM63 is therefore inhibition of LOC122258 (Accession NP_660291.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122258.

[8459] LOC123346 (Accession XP_063609.1) is another GAM63 target gene, herein designated TARGET GENE. LOC123346 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC123346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123346 BINDING SITE, designated SEQ ID:1872, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8460] Another function of GAM63 is therefore inhibition of

LOC123346 (Accession XP_063609.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123346.

[8461] LOC124245 (Accession NP_653205.2) is another GAM63 target gene, herein designated TARGET GENE. LOC124245 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC124245, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124245 BINDING SITE, designated SEQ ID:3920, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8462] Another function of GAM63 is therefore inhibition of LOC124245 (Accession NP_653205.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124245.

[8463] LOC130074 (Accession XP_072228.2) is another GAM63 target gene, herein designated TARGET GENE. LOC130074 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130074, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:8538, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8464] Another function of GAM63 is therefore inhibition of LOC130074 (Accession XP_072228.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074.

[8465] LOC130644 (Accession XP_065813.2) is another GAM63 target gene, herein designated TARGET GENE. LOC130644 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130644, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130644 BINDING SITE, designated SEQ ID:11552, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8466] Another function of GAM63 is therefore inhibition of LOC130644 (Accession XP_065813.2) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130644.

[8467] LOC130916 (Accession XP_059481.2) is another GAM63 target gene, herein designated TARGET GENE. LOC130916 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC130916, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130916 BINDING SITE, designated SEQ ID:2189, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8468] Another function of GAM63 is therefore inhibition of LOC130916 (Accession XP_059481.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130916.

[8469] LOC132235 (Accession XP_072302.1) is another GAM63 target gene, herein designated TARGET GENE. LOC132235 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC132235, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:19785, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8470] Another function of GAM63 is therefore inhibition of LOC132235 (Accession XP_072302.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235.

[8471] LOC132948 (Accession NP_660307.1) is another GAM63 target gene, herein designated TARGET GENE. LOC132948 BINDING SITE1 and LOC132948 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC132948, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132948 BINDING SITE1 and LOC132948 BINDING SITE2, designated SEQ ID:3612 and SEQ ID:7690 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8472] Another function of GAM63 is therefore inhibition of

LOC132948 (Accession NP_660307.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132948.

[8473] LOC139201 (Accession XP_208439.1) is another GAM63 target gene, herein designated TARGET GENE. LOC139201 BINDING SITE1 and LOC139201 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC139201, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC139201 BINDING SITE1 and LOC139201 BINDING SITE2, designated SEQ ID:11945 and SEQ ID:1459 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8474] Another function of GAM63 is therefore inhibition of LOC139201 (Accession XP_208439.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139201.

[8475] LOC144467 (Accession NP_612482.1) is another GAM63 target gene, herein designated TARGET GENE. LOC144467

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144467, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144467 BINDING SITE, designated SEQ ID:10729, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8476] Another function of GAM63 is therefore inhibition of LOC144467 (Accession NP_612482.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144467.

[8477] LOC144667 (Accession XP_096648.1) is another GAM63 target gene, herein designated TARGET GENE. LOC144667 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144667, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144667 BINDING SITE, designated SEQ ID:19348, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8478] Another function of GAM63 is therefore inhibition of LOC144667 (Accession XP_096648.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144667.

[8479] LOC144705 (Accession XP_096669.1) is another GAM63 target gene, herein designated TARGET GENE. LOC144705 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144705, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144705 BINDING SITE, designated SEQ ID:10034, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8480] Another function of GAM63 is therefore inhibition of LOC144705 (Accession XP_096669.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144705.

[8481] LOC146562 (Accession NP_631909.1) is another GAM63 target gene, herein designated TARGET GENE. LOC146562 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC146562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146562 BINDING SITE, designated SEQ ID:2282, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8482] Another function of GAM63 is therefore inhibition of LOC146562 (Accession NP_631909.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146562.

[8483] LOC147123 (Accession XP_085714.2) is another GAM63 target gene, herein designated TARGET GENE. LOC147123 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147123 BINDING SITE, designated SEQ ID:2993, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8484] Another function of GAM63 is therefore inhibition of

LOC147123 (Accession XP_085714.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147123.

[8485] LOC148056 (Accession XP_097380.1) is another GAM63 target gene, herein designated TARGET GENE. LOC148056 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148056 BINDING SITE, designated SEQ ID:4395, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8486] Another function of GAM63 is therefore inhibition of LOC148056 (Accession XP_097380.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148056.

[8487] LOC149466 (Accession XP_086546.1) is another GAM63 target gene, herein designated TARGET GENE. LOC149466 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149466, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149466 BINDING SITE, designated SEQ ID:3852, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8488] Another function of GAM63 is therefore inhibition of LOC149466 (Accession XP_086546.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149466.

[8489] LOC149478 (Accession XP_086536.1) is another GAM63 target gene, herein designated TARGET GENE. LOC149478 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149478, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:8470, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8490] Another function of GAM63 is therefore inhibition of LOC149478 (Accession XP_086536.1) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478.

[8491] LOC150035 (Accession XP_097793.1) is another GAM63 target gene, herein designated TARGET GENE. LOC150035 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150035 BINDING SITE, designated SEQ ID:15062, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8492] Another function of GAM63 is therefore inhibition of LOC150035 (Accession XP_097793.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150035.

[8493] LOC150054 (Accession XP_097797.1) is another GAM63 target gene, herein designated TARGET GENE. LOC150054 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150054, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:10173, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8494] Another function of GAM63 is therefore inhibition of LOC150054 (Accession XP_097797.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054.

[8495] LOC150383 (Accession XP_086905.1) is another GAM63 target gene, herein designated TARGET GENE. LOC150383 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150383, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150383 BINDING SITE, designated SEQ ID:18710, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8496] Another function of GAM63 is therefore inhibition of LOC150383 (Accession XP_086905.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150383.

[8497] LOC151475 (Accession XP_098063.1) is another GAM63 target gene, herein designated TARGET GENE. LOC151475 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151475, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:8600, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8498] Another function of GAM63 is therefore inhibition of LOC151475 (Accession XP_098063.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475.

[8499] LOC151623 (Accession XP_098096.5) is another GAM63 target gene, herein designated TARGET GENE. LOC151623 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151623, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC151623 BINDING SITE, designated SEQ ID:8648, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8500] Another function of GAM63 is therefore inhibition of LOC151623 (Accession XP_098096.5) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151623.

[8501] LOC153711 (Accession XP_098419.1) is another GAM63 target gene, herein designated TARGET GENE. LOC153711 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153711, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:14953, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8502] Another function of GAM63 is therefore inhibition of LOC153711 (Accession XP_098419.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153711.

[8503] LOC153894 (Accession XP_087796.1) is another GAM63 target gene, herein designated TARGET GENE. LOC153894 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153894 BINDING SITE, designated SEQ ID:16220, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8504] Another function of GAM63 is therefore inhibition of LOC153894 (Accession XP_087796.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153894.

[8505] LOC157278 (Accession XP_098741.2) is another GAM63 target gene, herein designated TARGET GENE. LOC157278 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157278, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC157278 BINDING SITE, designated SEQ ID:8648, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8506] Another function of GAM63 is therefore inhibition of LOC157278 (Accession XP_098741.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157278.

[8507] LOC157931 (Accession XP_098845.1) is another GAM63 target gene, herein designated TARGET GENE. LOC157931 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157931 BINDING SITE, designated SEQ ID:3446, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8508] Another function of GAM63 is therefore inhibition of LOC157931 (Accession XP_098845.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157931.

[8509] LOC158563 (Accession XP_088606.1) is another GAM63 target gene, herein designated TARGET GENE. LOC158563 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158563, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:1153, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8510] Another function of GAM63 is therefore inhibition of LOC158563 (Accession XP_088606.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563.

[8511] LOC158709 (Accession XP_088648.1) is another GAM63 target gene, herein designated TARGET GENE. LOC158709 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158709, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158709 BINDING SITE, designated SEQ ID:17046, to

the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8512] Another function of GAM63 is therefore inhibition of LOC158709 (Accession XP_088648.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158709.

[8513] LOC159121 (Accession XP_099028.1) is another GAM63 target gene, herein designated TARGET GENE. LOC159121 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC159121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159121 BINDING SITE, designated SEQ ID:6485, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8514] Another function of GAM63 is therefore inhibition of LOC159121 (Accession XP_099028.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159121.

[8515] LOC159963 (Accession XP_089960.6) is another GAM63

target gene, herein designated TARGET GENE. LOC159963 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC159963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159963 BINDING SITE, designated SEQ ID:5201, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8516] Another function of GAM63 is therefore inhibition of LOC159963 (Accession XP_089960.6) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159963.

[8517] LOC160824 (Accession XP_090522.2) is another GAM63 target gene, herein designated TARGET GENE. LOC160824 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC160824, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC160824 BINDING SITE, designated SEQ ID:4898, to the nucleotide sequence of GAM63 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:348.

[8518] Another function of GAM63 is therefore inhibition of LOC160824 (Accession XP_090522.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160824.

[8519] LOC196446 (Accession XP_113722.2) is another GAM63 target gene, herein designated TARGET GENE. LOC196446 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC196446, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196446 BINDING SITE, designated SEQ ID:19172, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8520] Another function of GAM63 is therefore inhibition of LOC196446 (Accession XP_113722.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196446.

[8521] LOC196996 (Accession XP_113796.1) is another GAM63 target gene, herein designated TARGET GENE. LOC196996

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196996, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196996 BINDING SITE, designated SEQ ID:405, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8522] Another function of GAM63 is therefore inhibition of LOC196996 (Accession XP_113796.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196996.

[8523] LOC199813 (Accession XP_114028.1) is another GAM63 target gene, herein designated TARGET GENE. LOC199813 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC199813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199813 BINDING SITE, designated SEQ ID:19093, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8524] Another function of GAM63 is therefore inhibition of LOC199813 (Accession XP_114028.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199813.

[8525] LOC200010 (Accession XP_117174.2) is another GAM63 target gene, herein designated TARGET GENE. LOC200010 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200010, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200010 BINDING SITE, designated SEQ ID:19405, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8526] Another function of GAM63 is therefore inhibition of LOC200010 (Accession XP_117174.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200010.

[8527] LOC200734 (Accession XP_114286.1) is another GAM63 target gene, herein designated TARGET GENE. LOC200734 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC200734, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200734 BINDING SITE, designated SEQ ID:7136, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8528] Another function of GAM63 is therefore inhibition of LOC200734 (Accession XP_114286.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200734.

[8529] LOC219918 (Accession XP_166197.1) is another GAM63 target gene, herein designated TARGET GENE. LOC219918 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219918, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219918 BINDING SITE, designated SEQ ID:13636, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8530] Another function of GAM63 is therefore inhibition of

LOC219918 (Accession XP_166197.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219918.

[8531] LOC220071 (Accession XP_167848.1) is another GAM63 target gene, herein designated TARGET GENE. LOC220071 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220071 BINDING SITE, designated SEQ ID:13636, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8532] Another function of GAM63 is therefore inhibition of LOC220071 (Accession XP_167848.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220071.

[8533] LOC221002 (Accession NP_660356.1) is another GAM63 target gene, herein designated TARGET GENE. LOC221002 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221002, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221002 BINDING SITE, designated SEQ ID:560, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8534] Another function of GAM63 is therefore inhibition of LOC221002 (Accession NP_660356.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221002.

[8535] LOC221495 (Accession XP_168136.1) is another GAM63 target gene, herein designated TARGET GENE. LOC221495 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221495, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221495 BINDING SITE, designated SEQ ID:2939, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8536] Another function of GAM63 is therefore inhibition of LOC221495 (Accession XP_168136.1) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495.

[8537] LOC221663 (Accession XP_168131.1) is another GAM63 target gene, herein designated TARGET GENE. LOC221663 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221663 BINDING SITE, designated SEQ ID:11468, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8538] Another function of GAM63 is therefore inhibition of LOC221663 (Accession XP_168131.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221663.

[8539] LOC222031 (Accession XP_168371.1) is another GAM63 target gene, herein designated TARGET GENE. LOC222031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222031, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:11030, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8540] Another function of GAM63 is therefore inhibition of LOC222031 (Accession XP_168371.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031.

[8541] LOC222057 (Accession XP_166594.2) is another GAM63 target gene, herein designated TARGET GENE. LOC222057 BINDING SITE1 and LOC222057 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC222057, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222057 BINDING SITE1 and LOC222057 BINDING SITE2, designated SEQ ID:11430 and SEQ ID:12029 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8542] Another function of GAM63 is therefore inhibition of

LOC222057 (Accession XP_166594.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222057.

[8543] LOC222674 (Accession XP_167095.3) is another GAM63 target gene, herein designated TARGET GENE. LOC222674 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222674, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222674 BINDING SITE, designated SEQ ID:14980, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8544] Another function of GAM63 is therefore inhibition of LOC222674 (Accession XP_167095.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222674.

[8545] LOC254559 (Accession XP_172931.2) is another GAM63 target gene, herein designated TARGET GENE. LOC254559 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254559, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254559 BINDING SITE, designated SEQ ID:19218, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8546] Another function of GAM63 is therefore inhibition of LOC254559 (Accession XP_172931.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254559.

[8547] LOC255743 (Accession XP_171089.2) is another GAM63 target gene, herein designated TARGET GENE. LOC255743 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255743, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255743 BINDING SITE, designated SEQ ID:1120, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8548] Another function of GAM63 is therefore inhibition of LOC255743 (Accession XP_171089.2) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255743.

[8549] LOC255975 (Accession XP_171083.2) is another GAM63 target gene, herein designated TARGET GENE. LOC255975 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:17165, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8550] Another function of GAM63 is therefore inhibition of LOC255975 (Accession XP_171083.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975.

[8551] LOC256106 (Accession XP_172187.1) is another GAM63 target gene, herein designated TARGET GENE. LOC256106 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256106, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256106 BINDING SITE, designated SEQ ID:11964, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8552] Another function of GAM63 is therefore inhibition of LOC256106 (Accession XP_172187.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256106.

[8553] LOC282959 (Accession XP_212622.1) is another GAM63 target gene, herein designated TARGET GENE. LOC282959 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282959, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282959 BINDING SITE, designated SEQ ID:12554, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8554] Another function of GAM63 is therefore inhibition of LOC282959 (Accession XP_212622.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC282959.

[8555] LOC282966 (Accession XP_208460.1) is another GAM63 target gene, herein designated TARGET GENE. LOC282966 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282966, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282966 BINDING SITE, designated SEQ ID:9105, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8556] Another function of GAM63 is therefore inhibition of LOC282966 (Accession XP_208460.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282966.

[8557] LOC283099 (Accession XP_210887.2) is another GAM63 target gene, herein designated TARGET GENE. LOC283099 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283099, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC283099 BINDING SITE, designated SEQ ID:2411, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8558] Another function of GAM63 is therefore inhibition of LOC283099 (Accession XP_210887.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283099.

[8559] LOC283158 (Accession XP_208530.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283158 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283158, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283158 BINDING SITE, designated SEQ ID:13317, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8560] Another function of GAM63 is therefore inhibition of LOC283158 (Accession XP_208530.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC283158.

[8561] LOC283177 (Accession XP_210903.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283177 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283177 BINDING SITE, designated SEQ ID:1528, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8562] Another function of GAM63 is therefore inhibition of LOC283177 (Accession XP_210903.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283177.

[8563] LOC283232 (Accession NP_777600.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283232 BINDING SITE, designated SEQ ID:12802, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8564] Another function of GAM63 is therefore inhibition of LOC283232 (Accession NP_777600.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283232.

[8565] LOC283243 (Accession XP_210947.2) is another GAM63 target gene, herein designated TARGET GENE. LOC283243 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283243, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283243 BINDING SITE, designated SEQ ID:8648, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8566] Another function of GAM63 is therefore inhibition of LOC283243 (Accession XP_210947.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283243.

[8567] LOC283324 (Accession XP_208617.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283324 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283324, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283324 BINDING SITE, designated SEQ ID:13636, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8568] Another function of GAM63 is therefore inhibition of LOC283324 (Accession XP_208617.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283324.

[8569] LOC283325 (Accession XP_208618.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283325 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283325, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283325 BINDING SITE, designated SEQ ID:10668, to

the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8570] Another function of GAM63 is therefore inhibition of LOC283325 (Accession XP_208618.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283325.

[8571] LOC283364 (Accession XP_211003.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283364 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283364, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283364 BINDING SITE, designated SEQ ID:3471, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8572] Another function of GAM63 is therefore inhibition of LOC283364 (Accession XP_211003.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283364.

[8573] LOC283389 (Accession XP_211009.1) is another GAM63

target gene, herein designated TARGET GENE. LOC283389 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283389, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283389 BINDING SITE, designated SEQ ID:10231, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8574] Another function of GAM63 is therefore inhibition of LOC283389 (Accession XP_211009.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283389.

[8575] LOC283507 (Accession XP_211075.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283507 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283507, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283507 BINDING SITE, designated SEQ ID:12549, to the nucleotide sequence of GAM63 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:348.

[8576] Another function of GAM63 is therefore inhibition of LOC283507 (Accession XP_211075.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283507.

[8577] LOC283514 (Accession XP_210264.2) is another GAM63 target gene, herein designated TARGET GENE. LOC283514 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283514, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283514 BINDING SITE, designated SEQ ID:12227, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8578] Another function of GAM63 is therefore inhibition of LOC283514 (Accession XP_210264.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283514.

[8579] LOC283706 (Accession XP_208804.3) is another GAM63 target gene, herein designated TARGET GENE. LOC283706

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283706, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283706 BINDING SITE, designated SEQ ID:10969, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8580] Another function of GAM63 is therefore inhibition of LOC283706 (Accession XP_208804.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283706.

[8581] LOC283868 (Accession XP_211243.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283868 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283868, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283868 BINDING SITE, designated SEQ ID:6589, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8582] Another function of GAM63 is therefore inhibition of LOC283868 (Accession XP_211243.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283868.

[8583] LOC283911 (Accession XP_211259.2) is another GAM63 target gene, herein designated TARGET GENE. LOC283911 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283911 BINDING SITE, designated SEQ ID:11030, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8584] Another function of GAM63 is therefore inhibition of LOC283911 (Accession XP_211259.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283911.

[8585] LOC283950 (Accession XP_211273.1) is another GAM63 target gene, herein designated TARGET GENE. LOC283950 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC283950, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283950 BINDING SITE, designated SEQ ID:2373, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8586] Another function of GAM63 is therefore inhibition of LOC283950 (Accession XP_211273.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283950.

[8587] LOC284074 (Accession XP_211321.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284074 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284074, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284074 BINDING SITE, designated SEQ ID:15991, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8588] Another function of GAM63 is therefore inhibition of

LOC284074 (Accession XP_211321.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284074.

[8589] LOC284134 (Accession XP_211345.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284134 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284134, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284134 BINDING SITE, designated SEQ ID:12578, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8590] Another function of GAM63 is therefore inhibition of LOC284134 (Accession XP_211345.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284134.

[8591] LOC284135 (Accession XP_209032.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284135 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284135, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284135 BINDING SITE, designated SEQ ID:15364, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8592] Another function of GAM63 is therefore inhibition of LOC284135 (Accession XP_209032.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284135.

[8593] LOC284186 (Accession XP_209060.2) is another GAM63 target gene, herein designated TARGET GENE. LOC284186 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284186 BINDING SITE, designated SEQ ID:2686, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8594] Another function of GAM63 is therefore inhibition of LOC284186 (Accession XP_209060.2) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284186.

[8595] LOC284187 (Accession XP_211366.2) is another GAM63 target gene, herein designated TARGET GENE. LOC284187 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284187, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284187 BINDING SITE, designated SEQ ID:11712, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8596] Another function of GAM63 is therefore inhibition of LOC284187 (Accession XP_211366.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284187.

[8597] LOC284382 (Accession XP_209177.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284382 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284382, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284382 BINDING SITE, designated SEQ ID:16203, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8598] Another function of GAM63 is therefore inhibition of LOC284382 (Accession XP_209177.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284382.

[8599] LOC284394 (Accession XP_210786.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284394 BINDING SITE1 and LOC284394 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284394, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284394 BINDING SITE1 and LOC284394 BINDING SITE2, designated SEQ ID:2616 and SEQ ID:10139 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8600] Another function of GAM63 is therefore inhibition of

LOC284394 (Accession XP_210786.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284394.

[8601] LOC284456 (Accession XP_211470.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284456 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284456 BINDING SITE, designated SEQ ID:8896, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8602] Another function of GAM63 is therefore inhibition of LOC284456 (Accession XP_211470.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284456.

[8603] LOC284585 (Accession XP_209277.2) is another GAM63 target gene, herein designated TARGET GENE. LOC284585 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284585, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284585 BINDING SITE, designated SEQ ID:18870, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8604] Another function of GAM63 is therefore inhibition of LOC284585 (Accession XP_209277.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284585.

[8605] LOC284673 (Accession XP_211591.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284673 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284673 BINDING SITE, designated SEQ ID:4694, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8606] Another function of GAM63 is therefore inhibition of LOC284673 (Accession XP_211591.1) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284673.

[8607] LOC284678 (Accession XP_209318.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284678 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284678, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284678 BINDING SITE, designated SEQ ID:13363, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8608] Another function of GAM63 is therefore inhibition of LOC284678 (Accession XP_209318.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284678.

[8609] LOC284701 (Accession XP_294994.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284701 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284701, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284701 BINDING SITE, designated SEQ ID:11430, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8610] Another function of GAM63 is therefore inhibition of LOC284701 (Accession XP_294994.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284701.

[8611] LOC284837 (Accession XP_211658.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284837 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284837 BINDING SITE, designated SEQ ID:14432, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8612] Another function of GAM63 is therefore inhibition of LOC284837 (Accession XP_211658.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284837.

[8613] LOC284891 (Accession XP_211683.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284891 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284891 BINDING SITE, designated SEQ ID:17073, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8614] Another function of GAM63 is therefore inhibition of LOC284891 (Accession XP_211683.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284891.

[8615] LOC284927 (Accession XP_211689.1) is another GAM63 target gene, herein designated TARGET GENE. LOC284927 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284927 BINDING SITE, designated SEQ ID:12266, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8616] Another function of GAM63 is therefore inhibition of LOC284927 (Accession XP_211689.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284927.

[8617] LOC285043 (Accession XP_211742.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285043 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285043, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285043 BINDING SITE, designated SEQ ID:5397, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8618] Another function of GAM63 is therefore inhibition of LOC285043 (Accession XP_211742.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285043.

[8619] LOC285045 (Accession XP_211744.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285045 BINDING SITE, designated SEQ ID:1894, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8620] Another function of GAM63 is therefore inhibition of LOC285045 (Accession XP_211744.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285045.

[8621] LOC285182 (Accession XP_211800.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285182 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285182 BINDING SITE, designated SEQ ID:7658, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8622] Another function of GAM63 is therefore inhibition of LOC285182 (Accession XP_211800.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285182.

[8623] LOC285329 (Accession XP_209569.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285329 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285329, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285329 BINDING SITE, designated SEQ ID:1257, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8624] Another function of GAM63 is therefore inhibition of LOC285329 (Accession XP_209569.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285329.

[8625] LOC285337 (Accession XP_211847.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285337 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285337 BINDING SITE, designated SEQ ID:18813, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8626] Another function of GAM63 is therefore inhibition of LOC285337 (Accession XP_211847.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285337.

[8627] LOC285363 (Accession XP_211870.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285363 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285363, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285363 BINDING SITE, designated SEQ ID:10101, to

the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8628] Another function of GAM63 is therefore inhibition of LOC285363 (Accession XP_211870.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285363.

[8629] LOC285408 (Accession XP_211886.3) is another GAM63 target gene, herein designated TARGET GENE. LOC285408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285408 BINDING SITE, designated SEQ ID:8648, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8630] Another function of GAM63 is therefore inhibition of LOC285408 (Accession XP_211886.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285408.

[8631] LOC285577 (Accession XP_211941.1) is another GAM63

target gene, herein designated TARGET GENE. LOC285577 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285577, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285577 BINDING SITE, designated SEQ ID:1035, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8632] Another function of GAM63 is therefore inhibition of LOC285577 (Accession XP_211941.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285577.

[8633] LOC285634 (Accession XP_209691.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285634 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285634, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285634 BINDING SITE, designated SEQ ID:15209, to the nucleotide sequence of GAM63 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:348.

[8634] Another function of GAM63 is therefore inhibition of LOC285634 (Accession XP_209691.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285634.

[8635] LOC285690 (Accession XP_209723.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285690 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285690, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285690 BINDING SITE, designated SEQ ID:11929, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8636] Another function of GAM63 is therefore inhibition of LOC285690 (Accession XP_209723.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285690.

[8637] LOC285714 (Accession XP_211994.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285714

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285714, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285714 BINDING SITE, designated SEQ ID:12512, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8638] Another function of GAM63 is therefore inhibition of LOC285714 (Accession XP_211994.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285714.

[8639] LOC285726 (Accession XP_211998.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285726 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285726, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285726 BINDING SITE, designated SEQ ID:1407, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8640] Another function of GAM63 is therefore inhibition of LOC285726 (Accession XP_211998.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285726.

[8641] LOC285747 (Accession XP_209742.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285747 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285747, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285747 BINDING SITE, designated SEQ ID:18138, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8642] Another function of GAM63 is therefore inhibition of LOC285747 (Accession XP_209742.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285747.

[8643] LOC285769 (Accession XP_209755.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285769 BINDING SITE1 and LOC285769 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by LOC285769, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285769 BINDING SITE1 and LOC285769 BINDING SITE2, designated SEQ ID:20180 and SEQ ID:11218 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8644] Another function of GAM63 is therefore inhibition of LOC285769 (Accession XP_209755.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285769.

[8645] LOC285771 (Accession XP_212015.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285771 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285771, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285771 BINDING SITE, designated SEQ ID:13902, to the nucleotide sequence of GAM63 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:348.

[8646] Another function of GAM63 is therefore inhibition of LOC285771 (Accession XP_212015.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285771.

[8647] LOC285831 (Accession XP_212577.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285831 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC285831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285831 BINDING SITE, designated SEQ ID:15227, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8648] Another function of GAM63 is therefore inhibition of LOC285831 (Accession XP_212577.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285831.

[8649] LOC285831 (Accession XP_209784.1) is another GAM63

target gene, herein designated TARGET GENE. LOC285831 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC285831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285831 BINDING SITE, designated SEQ ID:15227, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8650] Another function of GAM63 is therefore inhibition of LOC285831 (Accession XP_209784.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285831.

[8651] LOC285831 (Accession XP_212625.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285831 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC285831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285831 BINDING SITE, desig-

nated SEQ ID:15227, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8652] Another function of GAM63 is therefore inhibition of LOC285831 (Accession XP_212625.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285831.

[8653] LOC285908 (Accession XP_209812.1) is another GAM63 target gene, herein designated TARGET GENE. LOC285908 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285908, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285908 BINDING SITE, designated SEQ ID:8743, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8654] Another function of GAM63 is therefore inhibition of LOC285908 (Accession XP_209812.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285908.

[8655] LOC286008 (Accession XP_212134.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286008 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286008, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286008 BINDING SITE, designated SEQ ID:17819, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8656] Another function of GAM63 is therefore inhibition of LOC286008 (Accession XP_212134.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286008.

[8657] LOC286030 (Accession XP_209868.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286030 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286030, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286030 BINDING SITE, designated SEQ ID:12513, to

the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8658] Another function of GAM63 is therefore inhibition of LOC286030 (Accession XP_209868.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286030.

[8659] LOC286032 (Accession XP_209867.2) is another GAM63 target gene, herein designated TARGET GENE. LOC286032 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286032, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286032 BINDING SITE, designated SEQ ID:11886, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8660] Another function of GAM63 is therefore inhibition of LOC286032 (Accession XP_209867.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286032.

[8661] LOC286039 (Accession XP_209873.1) is another GAM63

target gene, herein designated TARGET GENE. LOC286039 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286039, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286039 BINDING SITE, designated SEQ ID:12513, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8662] Another function of GAM63 is therefore inhibition of LOC286039 (Accession XP_209873.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286039.

[8663] LOC286059 (Accession XP_212156.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286059 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286059, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286059 BINDING SITE, designated SEQ ID:14796, to the nucleotide sequence of GAM63 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:348.

[8664] Another function of GAM63 is therefore inhibition of LOC286059 (Accession XP_212156.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286059.

[8665] LOC286141 (Accession XP_212205.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286141 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286141, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286141 BINDING SITE, designated SEQ ID:8298, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8666] Another function of GAM63 is therefore inhibition of LOC286141 (Accession XP_212205.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286141.

[8667] LOC286163 (Accession XP_209922.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286163

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286163, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286163 BINDING SITE, designated SEQ ID:10366, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8668] Another function of GAM63 is therefore inhibition of LOC286163 (Accession XP_209922.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286163.

[8669] LOC286199 (Accession XP_212227.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286199 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286199, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286199 BINDING SITE, designated SEQ ID:7887, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8670] Another function of GAM63 is therefore inhibition of LOC286199 (Accession XP_212227.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286199.

[8671] LOC286215 (Accession XP_212228.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286215 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286215, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286215 BINDING SITE, designated SEQ ID:19160, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8672] Another function of GAM63 is therefore inhibition of LOC286215 (Accession XP_212228.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286215.

[8673] LOC286219 (Accession XP_212236.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286219 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC286219, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286219 BINDING SITE, designated SEQ ID:593, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8674] Another function of GAM63 is therefore inhibition of LOC286219 (Accession XP_212236.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286219.

[8675] LOC286221 (Accession XP_212233.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286221 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286221, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286221 BINDING SITE, designated SEQ ID:15764, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8676] Another function of GAM63 is therefore inhibition of

LOC286221 (Accession XP_212233.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286221.

[8677] LOC286256 (Accession XP_209970.2) is another GAM63 target gene, herein designated TARGET GENE. LOC286256 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286256, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286256 BINDING SITE, designated SEQ ID:16796, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8678] Another function of GAM63 is therefore inhibition of LOC286256 (Accession XP_209970.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286256.

[8679] LOC286434 (Accession XP_301085.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286434 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286434, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286434 BINDING SITE, designated SEQ ID:17046, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8680] Another function of GAM63 is therefore inhibition of LOC286434 (Accession XP_301085.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286434.

[8681] LOC286501 (Accession XP_210079.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286501 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286501, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286501 BINDING SITE, designated SEQ ID:10562, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8682] Another function of GAM63 is therefore inhibition of LOC286501 (Accession XP_210079.1) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286501.

[8683] LOC286567 (Accession XP_212343.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286567 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286567, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286567 BINDING SITE, designated SEQ ID:12106, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8684] Another function of GAM63 is therefore inhibition of LOC286567 (Accession XP_212343.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286567.

[8685] LOC286572 (Accession XP_212341.1) is another GAM63 target gene, herein designated TARGET GENE. LOC286572 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286572, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286572 BINDING SITE, designated SEQ ID:12106, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8686] Another function of GAM63 is therefore inhibition of LOC286572 (Accession XP_212341.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286572.

[8687] LOC338709 (Accession XP_211595.2) is another GAM63 target gene, herein designated TARGET GENE. LOC338709 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338709, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338709 BINDING SITE, designated SEQ ID:11430, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8688] Another function of GAM63 is therefore inhibition of LOC338709 (Accession XP_211595.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC338709.

[8689] LOC338760 (Accession XP_290556.2) is another GAM63 target gene, herein designated TARGET GENE. LOC338760 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338760, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338760 BINDING SITE, designated SEQ ID:16183, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8690] Another function of GAM63 is therefore inhibition of LOC338760 (Accession XP_290556.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338760.

[8691] LOC338812 (Accession XP_290587.2) is another GAM63 target gene, herein designated TARGET GENE. LOC338812 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC338812 BINDING SITE, designated SEQ ID:5910, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8692] Another function of GAM63 is therefore inhibition of LOC338812 (Accession XP_290587.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338812.

[8693] LOC338842 (Accession XP_294729.1) is another GAM63 target gene, herein designated TARGET GENE. LOC338842 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338842, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338842 BINDING SITE, designated SEQ ID:3177, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8694] Another function of GAM63 is therefore inhibition of LOC338842 (Accession XP_294729.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC338842.

[8695] LOC339178 (Accession XP_290742.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339178 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339178, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339178 BINDING SITE, designated SEQ ID:9390, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8696] Another function of GAM63 is therefore inhibition of LOC339178 (Accession XP_290742.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339178.

[8697] LOC339201 (Accession XP_290756.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339201 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC339201 BINDING SITE, designated SEQ ID:12179, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8698] Another function of GAM63 is therefore inhibition of LOC339201 (Accession XP_290756.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339201.

[8699] LOC339238 (Accession XP_290784.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339238 BINDING SITE1 and LOC339238 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by LOC339238, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339238 BINDING SITE1 and LOC339238 BINDING SITE2, designated SEQ ID:14379 and SEQ ID:4093 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8700] Another function of GAM63 is therefore inhibition of LOC339238 (Accession XP_290784.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC339238.

[8701] LOC339290 (Accession XP_294901.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339290 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339290, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339290 BINDING SITE, designated SEQ ID:14427, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8702] Another function of GAM63 is therefore inhibition of LOC339290 (Accession XP_294901.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339290.

[8703] LOC339392 (Accession XP_294925.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339392 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339392, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC339392 BINDING SITE, designated SEQ ID:15380, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8704] Another function of GAM63 is therefore inhibition of LOC339392 (Accession XP_294925.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339392.

[8705] LOC339778 (Accession XP_295061.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339778 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339778, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339778 BINDING SITE, designated SEQ ID:12879, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8706] Another function of GAM63 is therefore inhibition of LOC339778 (Accession XP_295061.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC339778.

[8707] LOC339846 (Accession XP_295084.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339846 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339846, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339846 BINDING SITE, designated SEQ ID:14168, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8708] Another function of GAM63 is therefore inhibition of LOC339846 (Accession XP_295084.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339846.

[8709] LOC339862 (Accession XP_291044.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339862 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339862, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC339862 BINDING SITE, designated SEQ ID:17721, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8710] Another function of GAM63 is therefore inhibition of LOC339862 (Accession XP_291044.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339862.

[8711] LOC339950 (Accession XP_294630.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339950 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339950, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339950 BINDING SITE, designated SEQ ID:3281, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8712] Another function of GAM63 is therefore inhibition of LOC339950 (Accession XP_294630.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339950.

[8713] LOC339983 (Accession XP_291101.1) is another GAM63 target gene, herein designated TARGET GENE. LOC339983 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339983, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339983 BINDING SITE, designated SEQ ID:7911, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8714] Another function of GAM63 is therefore inhibition of LOC339983 (Accession XP_291101.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339983.

[8715] LOC340125 (Accession XP_291150.1) is another GAM63 target gene, herein designated TARGET GENE. LOC340125 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340125 BINDING SITE, designated SEQ ID:11430, to

the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8716] Another function of GAM63 is therefore inhibition of LOC340125 (Accession XP_291150.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340125.

[8717] LOC340227 (Accession XP_291203.1) is another GAM63 target gene, herein designated TARGET GENE. LOC340227 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340227, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340227 BINDING SITE, designated SEQ ID:11430, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8718] Another function of GAM63 is therefore inhibition of LOC340227 (Accession XP_291203.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340227.

[8719] LOC340290 (Accession XP_291214.1) is another GAM63

target gene, herein designated TARGET GENE. LOC340290 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340290, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340290 BINDING SITE, designated SEQ ID:11430, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8720] Another function of GAM63 is therefore inhibition of LOC340290 (Accession XP_291214.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340290.

[8721] LOC340340 (Accession XP_295215.1) is another GAM63 target gene, herein designated TARGET GENE. LOC340340 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340340, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340340 BINDING SITE, designated SEQ ID:14545, to the nucleotide sequence of GAM63 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:348.

[8722] Another function of GAM63 is therefore inhibition of LOC340340 (Accession XP_295215.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340340.

[8723] LOC340362 (Accession XP_295225.1) is another GAM63 target gene, herein designated TARGET GENE. LOC340362 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340362, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340362 BINDING SITE, designated SEQ ID:16910, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8724] Another function of GAM63 is therefore inhibition of LOC340362 (Accession XP_295225.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340362.

[8725] LOC340408 (Accession XP_291274.1) is another GAM63 target gene, herein designated TARGET GENE. LOC340408

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340408 BINDING SITE, designated SEQ ID:12513, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8726] Another function of GAM63 is therefore inhibition of LOC340408 (Accession XP_291274.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340408.

[8727] LOC340528 (Accession XP_295268.1) is another GAM63 target gene, herein designated TARGET GENE. LOC340528 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340528, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340528 BINDING SITE, designated SEQ ID:12693, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8728] Another function of GAM63 is therefore inhibition of LOC340528 (Accession XP_295268.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340528.

[8729] LOC341036 (Accession XP_295967.2) is another GAM63 target gene, herein designated TARGET GENE. LOC341036 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC341036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC341036 BINDING SITE, designated SEQ ID:990, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8730] Another function of GAM63 is therefore inhibition of LOC341036 (Accession XP_295967.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC341036.

[8731] LOC342195 (Accession XP_292413.1) is another GAM63 target gene, herein designated TARGET GENE. LOC342195 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC342195, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342195 BINDING SITE, designated SEQ ID:752, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8732] Another function of GAM63 is therefore inhibition of LOC342195 (Accession XP_292413.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342195.

[8733] LOC343052 (Accession XP_295309.1) is another GAM63 target gene, herein designated TARGET GENE. LOC343052 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC343052, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC343052 BINDING SITE, designated SEQ ID:11315, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8734] Another function of GAM63 is therefore inhibition of

LOC343052 (Accession XP_295309.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC343052.

[8735] LOC343127 (Accession XP_295364.1) is another GAM63 target gene, herein designated TARGET GENE. LOC343127 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC343127, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC343127 BINDING SITE, designated SEQ ID:15167, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8736] Another function of GAM63 is therefore inhibition of LOC343127 (Accession XP_295364.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC343127.

[8737] LOC344051 (Accession XP_297346.1) is another GAM63 target gene, herein designated TARGET GENE. LOC344051 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC344051, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC344051 BINDING SITE, designated SEQ ID:6198, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8738] Another function of GAM63 is therefore inhibition of LOC344051 (Accession XP_297346.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC344051.

[8739] LOC347804 (Accession XP_166630.4) is another GAM63 target gene, herein designated TARGET GENE. LOC347804 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347804 BINDING SITE, designated SEQ ID:16952, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8740] Another function of GAM63 is therefore inhibition of LOC347804 (Accession XP_166630.4) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347804.

[8741] LOC348071 (Accession XP_300620.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348071 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348071 BINDING SITE, designated SEQ ID:19753, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8742] Another function of GAM63 is therefore inhibition of LOC348071 (Accession XP_300620.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348071.

[8743] LOC348146 (Accession XP_300640.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348146 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348146, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348146 BINDING SITE, designated SEQ ID:2347, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8744] Another function of GAM63 is therefore inhibition of LOC348146 (Accession XP_300640.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348146.

[8745] LOC348389 (Accession XP_302739.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348389 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348389, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348389 BINDING SITE, designated SEQ ID:5103, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8746] Another function of GAM63 is therefore inhibition of LOC348389 (Accession XP_302739.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348389.

[8747] LOC348416 (Accession XP_300733.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348416 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348416 BINDING SITE, designated SEQ ID:6373, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8748] Another function of GAM63 is therefore inhibition of LOC348416 (Accession XP_300733.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348416.

[8749] LOC348452 (Accession XP_300742.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348452 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348452, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC348452 BINDING SITE, designated SEQ ID:14880, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8750] Another function of GAM63 is therefore inhibition of LOC348452 (Accession XP_300742.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348452.

[8751] LOC348488 (Accession XP_300352.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348488 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348488, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348488 BINDING SITE, designated SEQ ID:14543, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8752] Another function of GAM63 is therefore inhibition of LOC348488 (Accession XP_300352.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348488.

[8753] LOC348508 (Accession XP_302806.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348508 BINDING SITE1 and LOC348508 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348508, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348508 BINDING SITE1 and LOC348508 BINDING SITE2, designated SEQ ID:12029 and SEQ ID:11430 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8754] Another function of GAM63 is therefore inhibition of LOC348508 (Accession XP_302806.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348508.

[8755] LOC348583 (Accession XP_302833.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348583 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348583, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348583 BINDING SITE, designated SEQ ID:928, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8756] Another function of GAM63 is therefore inhibition of LOC348583 (Accession XP_302833.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348583.

[8757] LOC348701 (Accession XP_300810.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348701 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348701, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348701 BINDING SITE, designated SEQ ID:1681, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8758] Another function of GAM63 is therefore inhibition of LOC348701 (Accession XP_300810.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348701.

[8759] LOC348780 (Accession XP_302884.1) is another GAM63 target gene, herein designated TARGET GENE. LOC348780 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348780, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348780 BINDING SITE, designated SEQ ID:17525, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8760] Another function of GAM63 is therefore inhibition of LOC348780 (Accession XP_302884.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348780.

[8761] LOC349080 (Accession XP_302952.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349080 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC349080 BINDING SITE, designated SEQ ID:11232, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8762] Another function of GAM63 is therefore inhibition of LOC349080 (Accession XP_302952.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349080.

[8763] LOC349161 (Accession XP_302970.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349161 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349161 BINDING SITE, designated SEQ ID:18078, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8764] Another function of GAM63 is therefore inhibition of LOC349161 (Accession XP_302970.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC349161.

[8765] LOC349277 (Accession XP_303016.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349277 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349277, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349277 BINDING SITE, designated SEQ ID:9154, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8766] Another function of GAM63 is therefore inhibition of LOC349277 (Accession XP_303016.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349277.

[8767] LOC349299 (Accession XP_303021.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349299 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349299, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC349299 BINDING SITE, designated SEQ ID:9154, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8768] Another function of GAM63 is therefore inhibition of LOC349299 (Accession XP_303021.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349299.

[8769] LOC349305 (Accession XP_301019.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349305 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349305, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349305 BINDING SITE, designated SEQ ID:18870, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8770] Another function of GAM63 is therefore inhibition of LOC349305 (Accession XP_301019.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349305.

[8771] LOC349307 (Accession XP_303024.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349307 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349307, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349307 BINDING SITE, designated SEQ ID:10059, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8772] Another function of GAM63 is therefore inhibition of LOC349307 (Accession XP_303024.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349307.

[8773] LOC349420 (Accession XP_301075.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349420 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349420, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349420 BINDING SITE, designated SEQ ID:11964, to

the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8774] Another function of GAM63 is therefore inhibition of LOC349420 (Accession XP_301075.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349420.

[8775] LOC349429 (Accession XP_301083.1) is another GAM63 target gene, herein designated TARGET GENE. LOC349429 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349429, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349429 BINDING SITE, designated SEQ ID:17046, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8776] Another function of GAM63 is therefore inhibition of LOC349429 (Accession XP_301083.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349429.

[8777] LOC350897 (Accession XP_303256.1) is another GAM63

target gene, herein designated TARGET GENE. LOC350897 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC350897, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC350897 BINDING SITE, designated SEQ ID:8471, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8778] Another function of GAM63 is therefore inhibition of LOC350897 (Accession XP_303256.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC350897.

[8779] LOC51236 (Accession NP_057542.2) is another GAM63 target gene, herein designated TARGET GENE. LOC51236 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51236, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51236 BINDING SITE, designated SEQ ID:6536, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[8780] Another function of GAM63 is therefore inhibition of LOC51236 (Accession NP_057542.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51236.

[8781] LOC90576 (Accession XP_032678.2) is another GAM63 target gene, herein designated TARGET GENE. LOC90576 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90576, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90576 BINDING SITE, designated SEQ ID:12424, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8782] Another function of GAM63 is therefore inhibition of LOC90576 (Accession XP_032678.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90576.

[8783] LOC90906 (Accession XP_034809.1) is another GAM63 target gene, herein designated TARGET GENE. LOC90906

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:10295, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8784] Another function of GAM63 is therefore inhibition of LOC90906 (Accession XP_034809.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906.

[8785] LOC91397 (Accession XP_038219.2) is another GAM63 target gene, herein designated TARGET GENE. LOC91397 BINDING SITE1 and LOC91397 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC91397, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE1 and LOC91397 BINDING SITE2, designated SEQ ID:11988 and SEQ ID:12564 respectively, to the nucleotide se-

quence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8786] Another function of GAM63 is therefore inhibition of LOC91397 (Accession XP_038219.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91397.

[8787] LOC91807 (Accession XP_040819.1) is another GAM63 target gene, herein designated TARGET GENE. LOC91807 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91807, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91807 BINDING SITE, designated SEQ ID:6003, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8788] Another function of GAM63 is therefore inhibition of LOC91807 (Accession XP_040819.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91807.

[8789] LOC92973 (Accession XP_048529.2) is another GAM63

target gene, herein designated TARGET GENE. LOC92973 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:17973, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8790] Another function of GAM63 is therefore inhibition of LOC92973 (Accession XP_048529.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973.

[8791] LOC93259 (Accession XP_050105.1) is another GAM63 target gene, herein designated TARGET GENE. LOC93259 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC93259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:18965, to the nucleotide sequence of GAM63 RNA, herein designated

GAM RNA, also designated SEQ ID:348.

[8792] Another function of GAM63 is therefore inhibition of LOC93259 (Accession XP_050105.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259.

[8793] Leupaxin (LPXN, Accession NP_004802.1) is another GAM63 target gene, herein designated TARGET GENE. LPXN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LPXN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LPXN BINDING SITE, designated SEQ ID:14409, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8794] Another function of GAM63 is therefore inhibition of Leupaxin (LPXN, Accession NP_004802.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPXN.

[8795] MAGED4 (Accession NP_803881.1) is another GAM63 target gene, herein designated TARGET GENE. MAGED4

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAGED4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAGED4 BINDING SITE, designated SEQ ID:11993, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8796] Another function of GAM63 is therefore inhibition of MAGED4 (Accession NP_803881.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGED4.

[8797] Mam domain containing 1 (MAMDC1, Accession XP_090827.3) is another GAM63 target gene, herein designated TARGET GENE. MAMDC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAMDC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAMDC1 BINDING SITE, designated SEQ ID:11453, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8798] Another function of GAM63 is therefore inhibition of Mam domain containing 1 (MAMDC1, Accession XP_090827.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAMDC1.

[8799] Mitogen-activated protein kinase kinase 4 (MAP2K4, Accession NP_003001.1) is another GAM63 target gene, herein designated TARGET GENE. MAP2K4 BINDING SITE1 and MAP2K4 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MAP2K4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE1 and MAP2K4 BINDING SITE2, designated SEQ ID:17579 and SEQ ID:7023 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8800] Another function of GAM63 is therefore inhibition of Mitogen-activated protein kinase kinase 4 (MAP2K4, Accession NP_003001.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4.

[8801] Map/microtubule affinity-regulating kinase 2 (MARK2,

Accession NP_004945.2) is another GAM63 target gene, herein designated TARGET GENE. MARK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MARK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MARK2 BINDING SITE, designated SEQ ID:4411, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8802] Another function of GAM63 is therefore inhibition of Map/microtubule affinity-regulating kinase 2 (MARK2, Accession NP_004945.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK2.

[8803] Map/microtubule affinity-regulating kinase 2 (MARK2, Accession NP_059672.1) is another GAM63 target gene, herein designated TARGET GENE. MARK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MARK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of MARK2 BINDING SITE, designated SEQ ID:4411, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8804] Another function of GAM63 is therefore inhibition of Map/microtubule affinity-regulating kinase 2 (MARK2, Accession NP_059672.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK2.

[8805] Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758870.1) is another GAM63 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:3578, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8806] Another function of GAM63 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession

NP_758870.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[8807] The function of MCP has been established by previous studies. MCP, a C3B/C4B- binding molecule of the complement system with cofactor activity for the I- dependent cleavage of C3B and C4B, is widely distributed in white blood cells, platelets, epithelial cells, and fibroblasts. Lublin et al. (1988) purified MCP from a human T- cell line and determined the sequence of the N- terminal 24 amino acids. An oligonucleotide probe was used to identify a clone from a human monocyte cDNA library. The deduced full- length MCP consists of a 34- amino acid signal peptide and a 350- amino acid mature protein. The protein has, beginning at the N terminus, 4 cysteine- rich repeating units (short consensus repeats, or SCRs) of about 60 amino acids each that match the consensus sequence found in a multigene family of complement regulatory proteins: CR1 (OMIM Ref. No. 120620), CR2 (OMIM Ref. No. 120650), C4BP (OMIM Ref. No. 120830), FH (OMIM Ref. No. 134370), and DAF (OMIM Ref. No. 125240). Immediately C- terminal of the SCRs is a serine/threo-

nine/proline (STP)- rich region, a likely area for extensive O- glycosylation. MCP also has a transmembrane domain, a basic amino acid anchor, and a cytoplasmic tail. Purcell et al. (1991) and Post et al. (1991) identified 4 and 6 isoforms of MCP, respectively. Post et al. (1991) demonstrated that the 6 isoforms vary in having 1 of 2 cytoplasmic tails and by having either all 3 STP regions (termed A, B, and C) or only STP- BC or STP- C. They showed that the STP- C isoforms are expressed as 45- to 55- kD proteins, the STP- BC isoforms are expressed as 55- to 65- kD proteins, and the STP- ABC isoforms are expressed as 65- to 75- kD proteins. The 65- to 75- kD variants were not expressed on peripheral blood cells or cell lines. Post et al. (1991) concluded that the presence of the B region of the STP area, which is richer in O- linked sugars, determines the expression of the 2 broad protein species. They also noted that up to 4 different forms of MCP are expressed on a single cell. Lublin et al. (1988) localized MCP to 1q31- q41 by Southern analysis of human- rodent somatic cell hybrid DNA and by in situ hybridization. This was the sixth member of this multigene family that had been assigned to this region of the genome. Bora et al. (1989) demonstrated that the MCP gene is on the same

1,250- kb NotI fragment that contains CR1, CR2, DAF, and C4BP and maps within 100 kb of the 3- prime end of the CR1 gene. The order of the genes appears to be that just indicated, with MCP preceding the other 4 genes.

[8808] Animal model experiments lend further support to the function of MCP. Marie et al. (2002) studied mice transgenic for human CD46 isoforms differing in their STP regions and in the length of their cytoplasmic domains. Mice expressing the 16- amino acid cytoplasmic tail variant, dubbed CD46- 1, inhibited the T cell- mediated contact hypersensitivity reaction, whereas those expression the 23- residue cytoplasmic tail variant, termed CD46- 2, increased it. CD46 stimulation or costimulation resulted in decreased cytotoxic activity and IL2 production, but increased proliferation and IL10 production, in CD46- 1 transgenic mice. The effects were reversed in CD46- 2 mice.

[8809] It is appreciated that the abovementioned animal model for MCP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8810] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[8811] Lublin, D. M.; Liszewski, M. K.; Post, T. W.; Arce, M. A.; LeBeau, M. M.; Rebentisch, M. B.; Lemons, R. S.; Seya, T.; Atkinson, J. [8845] Further studies establishing the function and utilities of MCP are found in John Hopkins OMIM database record ID 120920, and in cited publications listed in Table 5, which are hereby incorporated by reference.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758867.1) is another GAM63

target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:3578, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8846] Another function of GAM63 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758867.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[8847] The function of MCP has been established by previous studies. MCP, a C3B/C4B- binding molecule of the complement system with cofactor activity for the I- dependent cleavage of C3B and C4B, is widely distributed in white blood cells, platelets, epithelial cells, and fibroblasts. Lublin et al. (1988) purified MCP from a human T- cell line and determined the sequence of the N- terminal 24 amino

acids. An oligonucleotide probe was used to identify a clone from a human monocyte cDNA library. The deduced full- length MCP consists of a 34- amino acid signal peptide and a 350- amino acid mature protein. The protein has, beginning at the N terminus, 4 cysteine- rich repeating units (short consensus repeats, or SCRs) of about 60 amino acids each that match the consensus sequence found in a multigene family of complement regulatory proteins: CR1 (OMIM Ref. No. 120620), CR2 (OMIM Ref. No. 120650), C4BP (OMIM Ref. No. 120830), FH (OMIM Ref. No. 134370), and DAF (OMIM Ref. No. 125240). Immediately C- terminal of the SCRs is a serine/threonine/proline (STP)- rich region, a likely area for extensive O- glycosylation. MCP also has a transmembrane domain, a basic amino acid anchor, and a cytoplasmic tail. Purcell et al. (1991) and Post et al. (1991) identified 4 and 6 isoforms of MCP, respectively. Post et al. (1991) demonstrated that the 6 isoforms vary in having 1 of 2 cytoplasmic tails and by having either all 3 STP regions (termed A, B, and C) or only STP- BC or STP- C. They showed that the STP- C isoforms are expressed as 45- to 55- kD proteins, the STP- BC isoforms are expressed as 55- to 65- kD proteins, and the STP- ABC isoforms are expressed as 65-

to 75- kD proteins. The 65- to 75- kD variants were not expressed on peripheral blood cells or cell lines. Post et al. (1991) concluded that the presence of the B region of the STP area, which is richer in O- linked sugars, determines the expression of the 2 broad protein species. They also noted that up to 4 different forms of MCP are expressed on a single cell. Lublin et al. (1988) localized MCP to 1q31- q41 by Southern analysis of human- rodent somatic cell hybrid DNA and by in situ hybridization. This was the sixth member of this multigene family that had been assigned to this region of the genome. Bora et al. (1989) demonstrated that the MCP gene is on the same 1,250- kb NotI fragment that contains CR1, CR2, DAF, and C4BP and maps within 100 kb of the 3- prime end of the CR1 gene. The order of the genes appears to be that just indicated, with MCP preceding the other 4 genes.

[8848] Animal model experiments lend further support to the function of MCP. Marie et al. (2002) studied mice transgenic for human CD46 isoforms differing in their STP regions and in the length of their cytoplasmic domains. Mice expressing the 16- amino acid cytoplasmic tail variant, dubbed CD46- 1, inhibited the T cell- mediated contact hypersensitivity reaction, whereas those expression the

23- residue cytoplasmic tail variant, termed CD46- 2, increased it. CD46 stimulation or costimulation resulted in decreased cytotoxic activity and IL2 production, but increased proliferation and IL10 production, in CD46- 1 transgenic mice. The effects were reversed in CD46- 2 mice.

[8849] It is appreciated that the abovementioned animal model for MCP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8850] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

No. 120620), CR2 (OMIM Ref. No. 120650), C4BP (OMIM Ref. No. 120830), FH (OMIM Ref. No. 134370), and DAF (OMIM Ref. No. 125240). Im-

mediately C- terminal of the SCRs is a serine/threonine/proline (STP)- rich region, a likely area for extensive O- glycosylation. MCP also has a transmembrane domain, a basic amino acid anchor, and a cytoplasmic tail. Purcell et al. (1991) and Post et al. (1991) identified 4 and 6 isoforms of MCP, respectively. Post et al. (1991) demonstrated that the 6 isoforms vary in having 1 of 2 cytoplasmic tails and by having either all 3 STP regions (termed A, B, and C) or only STP- BC or STP- C. They showed that the STP- C isoforms are expressed as 45- to 55- kD proteins, the STP- BC isoforms are expressed as 55- to 65- kD proteins, and the STP- ABC isoforms are expressed as 65- to 75- kD proteins. The 65- to 75- kD variants were not expressed on peripheral blood cells or cell lines. Post et al. (1991) concluded that the presence of the B region of the STP area, which is richer in O- linked sugars, determines the expression of the 2 broad protein species. They also noted that up to 4 different forms of MCP are expressed on a single cell. Lublin et al. (1988) localized MCP to 1q31- q41 by Southern analysis of human- rodent somatic cell hybrid DNA and by in situ hybridization. This was the sixth member of this multigene family that had been assigned to this region of the genome. Bora et al.

(1989) demonstrated that the MCP gene is on the same 1,250- kb NotI fragment that contains CR1, CR2, DAF, and C4BP and maps within 100 kb of the 3- prime end of the CR1 gene. The order of the genes appears to be that just indicated, with MCP preceding the other 4 genes.

[8888] Animal model experiments lend further support to the function of MCP. Marie et al. (2002) studied mice transgenic for human CD46 isoforms differing in their STP regions and in the length of their cytoplasmic domains. Mice expressing the 16- amino acid cytoplasmic tail variant, dubbed CD46- 1, inhibited the T cell- mediated contact hypersensitivity reaction, whereas those expression the 23- residue cytoplasmic tail variant, termed CD46- 2, increased it. CD46 stimulation or costimulation resulted in decreased cytotoxic activity and IL2 production, but increased proliferation and IL10 production, in CD46- 1 transgenic mice. The effects were reversed in CD46- 2 mice.

[8889] It is appreciated that the abovementioned animal model for MCP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8890] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[8891] Lublin, D. M.; Liszewski, M. K.; Post, T. W.; Arce, M. A.; LeBeau, M. M.; Rebentisch, M. B.; Lemons, R. S.; Seya, T.; Atkinson, J. P. : Molecular cloning and chromosomal localization of human complement membrane cofactor protein (MCP): evidence for inclusion in the multigene family of complement- regulatory proteins. J. Exp. Med. 168: 181-194, 1988. ; and

[8892] Post, T. W.; Liszewski, M. K.; Adams, E. M.; Tedja, I.; Miller, E. A.; Atkinson, J. P. : Membrane cofactor protein of the complement system: alternative splicing of serine/ threonine/prol.

[8893] Further studies establishing the function and utilities of MCP are found in John Hopkins OMIM database record ID 120920, and in cited publications listed in Table 5, which are hereby incorporated by reference.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758862.1) is another GAM63 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:3578, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8894] Another function of GAM63 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758862.1), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[8895] The function of MCP has been established by previous studies. MCP, a C3B/C4B- binding molecule of the complement system with cofactor activity for the I- dependent cleavage of C3B and C4B, is widely distributed in white blood cells, platelets, epithelial cells, and fibroblasts. Lublin et al. (1988) purified MCP from a human T- cell line and determined the sequence of the N- terminal 24 amino acids. An oligonucleotide probe was used to identify a clone from a human monocyte cDNA library. The deduced full- length MCP consists of a 34- amino acid signal peptide and a 350- amino acid mature protein. The protein

has, beginning at the N terminus, 4 cysteine- rich repeating units (short consensus repeats, or SCRs) of about 60 amino acids each that match the consensus sequence found in a multigene family of complement regulatory proteins: CR1 (OMIM Ref. No. 120620), CR2 (OMIM Ref. No. 120650), C4BP (OMIM Ref. No. 120830), FH (OMIM Ref. No. 134370), and DAF (OMIM Ref. No. 125240). Immediately C- terminal of the SCRs is a serine/threonine/proline (STP)- rich region, a likely area for extensive O- glycosylation. MCP also has a transmembrane domain, a basic amino acid anchor, and a cytoplasmic tail. Purcell et al. (1991) and Post et al. (1991) identified 4 and 6 isoforms of MCP, respectively. Post et al. (1991) demonstrated that the 6 isoforms vary in having 1 of 2 cytoplasmic tails and by having either all 3 STP regions (termed A, B, and C) or only STP- BC or STP- C. They showed that the STP- C isoforms are expressed as 45- to 55- kD proteins, the STP- BC isoforms are expressed as 55- to 65- kD proteins, and the STP- ABC isoforms are expressed as 65- to 75- kD proteins. The 65- to 75- kD variants were not expressed on peripheral blood cells or cell lines. Post et al. (1991) concluded that the presence of the B region of the STP area, which is richer in O- linked sugars, deter-

mines the expression of the 2 broad protein species. They also noted that up to 4 different forms of MCP are expressed on a single cell. Lublin et al. (1988) localized MCP to 1q31- q41 by Southern analysis of human- rodent somatic cell hybrid DNA and by in situ hybridization. This was the sixth member of this multigene family that had been assigned to this region of the genome. Bora et al. (1989) demonstrated that the MCP gene is on the same 1,250- kb NotI fragment that contains CR1, CR2, DAF, and C4BP and maps within 100 kb of the 3- prime end of the CR1 gene. The order of the genes appears to be that just indicated, with MCP preceding the other 4 genes.

[8896] Animal model experiments lend further support to the function of MCP. Marie et al. (2002) studied mice transgenic for human CD46 isoforms differing in their STP regions and in the length of their cytoplasmic domains. Mice expressing the 16- amino acid cytoplasmic tail variant, dubbed CD46- 1, inhibited the T cell- mediated contact hypersensitivity reaction, whereas those expression the 23- residue cytoplasmic tail variant, termed CD46- 2, increased it. CD46 stimulation or costimulation resulted in decreased cytotoxic activity and IL2 production, but increased proliferation and IL10 production, in CD46- 1

transgenic mice. The effects were reversed in CD46- 2 mice.

[8897] It is appreciated that the abovementioned animal model for MCP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8898] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8899] Lublin, D. M.; Liszewski, M. K.; Post, T. W.; Arce, M. A.; LeBeau, M. M.; Rebentisch, M. B.; Lemons, R. S.; Seya, T.; Atkinson, J. P. : Molecular cloning and chromosomal localization of human complement membrane cofactor protein (MCP): evidence for inclusion in the multigene family of complement- regulatory proteins. J. Exp. Med. 168: 181-194, 1988. ; and

[8900] Post, T. W.; Liszewski, M. K.; Adams, E. M.; Tedja, I.; Miller, E. A.; Atkinson, J. P. : Membrane cofactor protein of the complement system: alternative splicing of serine/ threonine/prol.

[8901] Further studies establishing the function and utilities of MCP are found in John Hopkins OMIM database record ID 120920, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_002380.3) is another GAM63 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:3578, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8902] Another function of GAM63 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_002380.3), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[8903] The function of MCP has been established by previous studies. MCP, a C3B/C4B- binding molecule of the complement system with cofactor activity for the I- dependent cleavage of C3B and C4B, is widely distributed in white

blood cells, platelets, epithelial cells, and fibroblasts. Lublin et al. (1988) purified MCP from a human T- cell line and determined the sequence of the N- terminal 24 amino acids. An oligonucleotide probe was used to identify a clone from a human monocyte cDNA library. The deduced full- length MCP consists of a 34- amino acid signal peptide and a 350- amino acid mature protein. The protein has, beginning at the N terminus, 4 cysteine- rich repeating units (short consensus repeats, or SCRs) of about 60 amino acids each that match the consensus sequence found in a multigene family of complement regulatory proteins: CR1 (OMIM Ref. No. 120620), CR2 (OMIM Ref. No. 120650), C4BP (OMIM Ref. No. 120830), FH (OMIM Ref. No. 134370), and DAF (OMIM Ref. No. 125240). Immediately C- terminal of the SCRs is a serine/threonine/proline (STP)- rich region, a likely area for extensive O- glycosylation. MCP also has a transmembrane domain, a basic amino acid anchor, and a cytoplasmic tail. Purcell et al. (1991) and Post et al. (1991) identified 4 and 6 isoforms of MCP, respectively. Post et al. (1991) demonstrated that the 6 isoforms vary in having 1 of 2 cytoplasmic tails and by having either all 3 STP regions (termed A, B, and C) or only STP- BC or STP- C. They showed that the

STP- C isoforms are expressed as 45- to 55- kD proteins, the STP- BC isoforms are expressed as 55- to 65- kD proteins, and the STP- ABC isoforms are expressed as 65- to 75- kD proteins. The 65- to 75- kD variants were not expressed on peripheral blood cells or cell lines. Post et al. (1991) concluded that the presence of the B region of the STP area, which is richer in O- linked sugars, determines the expression of the 2 broad protein species. They also noted that up to 4 different forms of MCP are expressed on a single cell. Lublin et al. (1988) localized MCP to 1q31- q41 by Southern analysis of human- rodent somatic cell hybrid DNA and by in situ hybridization. This was the sixth member of this multigene family that had been assigned to this region of the genome. Bora et al. (1989) demonstrated that the MCP gene is on the same 1,250- kb NotI fragment that contains CR1, CR2, DAF, and C4BP and maps within 100 kb of the 3- prime end of the CR1 gene. The order of the genes appears to be that just indicated, with MCP preceding the other 4 genes.

[8904] Animal model experiments lend further support to the function of MCP. Marie et al. (2002) studied mice transgenic for human CD46 isoforms differing in their STP regions and in the length of their cytoplasmic domains. Mice

expressing the 16- amino acid cytoplasmic tail variant, dubbed CD46- 1, inhibited the T cell- mediated contact hypersensitivity reaction, whereas those expression the 23- residue cytoplasmic tail variant, termed CD46- 2, increased it. CD46 stimulation or costimulation resulted in decreased cytotoxic activity and IL2 production, but increased proliferation and IL10 production, in CD46- 1 transgenic mice. The effects were reversed in CD46- 2 mice.

[8905] It is appreciated that the abovementioned animal model for MCP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8906] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8907] Lublin, D. M.; Liszewski, M. K.; Post, T. W.; Arce, M. A.; LeBeau, M. M.; Rebentisch, M. B.; Lemons, R. S.; Seya, T.; Atkinson, J. P. : Molecular cloning and chromosomal localization of human complement membrane cofactor protein (MCP): evidence for inclusion in the multigene family of complement- regulatory proteins. J. Exp. Med. 168: 181-194, 1988. ; and

[8908] Post, T. W.; Liszewski, M. K.; Adams, E. M.; Tedja, I.; Miller, E. A.; Atkinson, J. P. : Membrane cofactor protein of the complement system: alternative splicing of serine/ threonine/prol.

[8909] Further studies establishing the function and utilities of MCP are found in John Hopkins OMIM database record ID 120920, and in cited publications listed in Table 5, which are hereby incorporated by reference.Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758868.1) is another GAM63 target gene, herein designated TARGET GENE. MCP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MCP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:3578, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8910] Another function of GAM63 is therefore inhibition of Membrane cofactor protein (cd46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NP_758868.1), a gene which may be involved in the regu-

lation of complement activation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP.

[8911] The function of MCP has been established by previous studies. MCP, a C3B/C4B- binding molecule of the complement system with cofactor activity for the I- dependent cleavage of C3B and C4B, is widely distributed in white blood cells, platelets, epithelial cells, and fibroblasts. Lublin et al. (1988) purified MCP from a human T- cell line and determined the sequence of the N- terminal 24 amino acids. An oligonucleotide probe was used to identify a clone from a human monocyte cDNA library. The deduced full- length MCP consists of a 34- amino acid signal peptide and a 350- amino acid mature protein. The protein has, beginning at the N terminus, 4 cysteine- rich repeating units (short consensus repeats, or SCRs) of about 60 amino acids each that match the consensus sequence found in a multigene family of complement regulatory proteins: CR1 (OMIM Ref. No. 120620), CR2 (OMIM Ref. No. 120650), C4BP (OMIM Ref. No. 120830), FH (OMIM Ref. No. 134370), and DAF (OMIM Ref. No. 125240). Immediately C- terminal of the SCRs is a serine/threonine/proline (STP)- rich region, a likely area for extensive

O- glycosylation. MCP also has a transmembrane domain, a basic amino acid anchor, and a cytoplasmic tail. Purcell et al. (1991) and Post et al. (1991) identified 4 and 6 isoforms of MCP, respectively. Post et al. (1991) demonstrated that the 6 isoforms vary in having 1 of 2 cytoplasmic tails and by having either all 3 STP regions (termed A, B, and C) or only STP- BC or STP- C. They showed that the STP- C isoforms are expressed as 45- to 55- kD proteins, the STP- BC isoforms are expressed as 55- to 65- kD proteins, and the STP- ABC isoforms are expressed as 65- to 75- kD proteins. The 65- to 75- kD variants were not expressed on peripheral blood cells or cell lines. Post et al. (1991) concluded that the presence of the B region of the STP area, which is richer in O- linked sugars, determines the expression of the 2 broad protein species. They also noted that up to 4 different forms of MCP are expressed on a single cell. Lublin et al. (1988) localized MCP to 1q31- q41 by Southern analysis of human- rodent somatic cell hybrid DNA and by in situ hybridization. This was the sixth member of this multigene family that had been assigned to this region of the genome. Bora et al. (1989) demonstrated that the MCP gene is on the same 1,250- kb NotI fragment that contains CR1, CR2, DAF,

and C4BP and maps within 100 kb of the 3- prime end of the CR1 gene. The order of the genes appears to be that just indicated, with MCP preceding the other 4 genes.

[8912] Animal model experiments lend further support to the function of MCP. Marie et al. (2002) studied mice transgenic for human CD46 isoforms differing in their STP regions and in the length of their cytoplasmic domains. Mice expressing the 16- amino acid cytoplasmic tail variant, dubbed CD46- 1, inhibited the T cell- mediated contact hypersensitivity reaction, whereas those expression the 23- residue cytoplasmic tail variant, termed CD46- 2, increased it. CD46 stimulation or costimulation resulted in decreased cytotoxic activity and IL2 production, but increased proliferation and IL10 production, in CD46- 1 transgenic mice. The effects were reversed in CD46- 2 mice.

[8913] It is appreciated that the abovementioned animal model for MCP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8914] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8915] Lublin, D. M.; Liszewski, M. K.; Post, T. W.; Arce, M. A.; LeBeau, M. M.; Rebentisch, M. B.; Lemons, R. S.; Seya, T.; Atkinson, J. P. : Molecular cloning and chromosomal localization of human complement membrane cofactor protein (MCP): evidence for inclusion in the multigene family of complement- regulatory proteins. J. Exp. Med. 168: 181-194, 1988. ; and

[8916] Post, T. W.; Liszewski, M. K.; Adams, E. M.; Tedja, I.; Miller, E. A.; Atkinson, J. P. : Membrane cofactor protein of the complement system: alternative splicing of serine/ threonine/prol.

[8917] Further studies establishing the function and utilities of MCP are found in John Hopkins OMIM database record ID 120920, and in cited publications listed in Table 5, which are hereby incorporated by reference.MEP50 (Accession NP_077007.1) is another GAM63 target gene, herein designated TARGET GENE. MEP50 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEP50, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEP50 BINDING SITE, designated SEQ ID:18671, to the nucleotide sequence of GAM63 RNA,

herein designated GAM RNA, also designated SEQ ID:348.

[8918] Another function of GAM63 is therefore inhibition of MEP50 (Accession NP_077007.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEP50.

[8919] Mesoderm development candidate 2 (MESDC2, Accession XP_051854.1) is another GAM63 target gene, herein designated TARGET GENE. MESDC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MESDC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:20061, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8920] Another function of GAM63 is therefore inhibition of Mesoderm development candidate 2 (MESDC2, Accession XP_051854.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2.

[8921] MESP2 (Accession XP_085261.1) is another GAM63 target gene, herein designated TARGET GENE. MESP2 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MESP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MESP2 BINDING SITE, designated SEQ ID:12071, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8922] Another function of GAM63 is therefore inhibition of MESP2 (Accession XP_085261.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESP2.

[8923] Max gene associated (MGA, Accession XP_031689.3) is another GAM63 target gene, herein designated TARGET GENE. MGA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGA BINDING SITE, designated SEQ ID:11668, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8924] Another function of GAM63 is therefore inhibition of Max

gene associated (MGA, Accession XP_031689.3), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGA.

[8925] The function of MGA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Mannosyl (alpha-1,6-)-glycoprotein beta-1,6-n-acetyl-glucosaminyltransferase (MGAT5, Accession NP_002401.1) is another GAM63 target gene, herein designated TARGET GENE. MGAT5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGAT5 BINDING SITE, designated SEQ ID:13161, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8926] Another function of GAM63 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein beta-1,6-n-acetyl-glucosaminyltransferase (MGAT5, Accession

NP_002401.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT5.

[8927] MGC10334 (Accession XP_300761.1) is another GAM63 target gene, herein designated TARGET GENE. MGC10334 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MGC10334, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10334 BINDING SITE, designated SEQ ID:14880, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8928] Another function of GAM63 is therefore inhibition of MGC10334 (Accession XP_300761.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10334.

[8929] MGC11115 (Accession NP_115686.2) is another GAM63 target gene, herein designated TARGET GENE. MGC11115 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11115, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:13254, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8930] Another function of GAM63 is therefore inhibition of MGC11115 (Accession NP_115686.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115.

[8931] MGC12262 (Accession NP_116085.1) is another GAM63 target gene, herein designated TARGET GENE. MGC12262 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC12262, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12262 BINDING SITE, designated SEQ ID:15149, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8932] Another function of GAM63 is therefore inhibition of MGC12262 (Accession NP_116085.1) . Accordingly, utili-

ties of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12262.

[8933] MGC14839 (Accession NP_542390.1) is another GAM63 target gene, herein designated TARGET GENE. MGC14839 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14839, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14839 BINDING SITE, designated SEQ ID:19092, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8934] Another function of GAM63 is therefore inhibition of MGC14839 (Accession NP_542390.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14839.

[8935] MGC16044 (Accession NP_612380.1) is another GAM63 target gene, herein designated TARGET GENE. MGC16044 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC16044, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16044 BINDING SITE, designated SEQ ID:13269, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8936] Another function of GAM63 is therefore inhibition of MGC16044 (Accession NP_612380.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16044.

[8937] MGC18216 (Accession NP_689665.1) is another GAM63 target gene, herein designated TARGET GENE. MGC18216 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC18216, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC18216 BINDING SITE, designated SEQ ID:10002, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8938] Another function of GAM63 is therefore inhibition of MGC18216 (Accession NP_689665.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC18216.

[8939] MGC20470 (Accession NP_659490.1) is another GAM63 target gene, herein designated TARGET GENE. MGC20470 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC20470, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC20470 BINDING SITE, designated SEQ ID:18986, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8940] Another function of GAM63 is therefore inhibition of MGC20470 (Accession NP_659490.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20470.

[8941] MGC26598 (Accession NP_689851.1) is another GAM63 target gene, herein designated TARGET GENE. MGC26598 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC26598, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC26598 BINDING SITE, designated SEQ ID:3683, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8942] Another function of GAM63 is therefore inhibition of MGC26598 (Accession NP_689851.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26598.

[8943] MGC3047 (Accession NP_115724.1) is another GAM63 target gene, herein designated TARGET GENE. MGC3047 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3047 BINDING SITE, designated SEQ ID:2308, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8944] Another function of GAM63 is therefore inhibition of MGC3047 (Accession NP_115724.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3047.

[8945] MGC3101 (Accession NP_076948.1) is another GAM63 target gene, herein designated TARGET GENE. MGC3101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:12469, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8946] Another function of GAM63 is therefore inhibition of MGC3101 (Accession NP_076948.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101.

[8947] MGC32020 (Accession NP_689479.1) is another GAM63 target gene, herein designated TARGET GENE. MGC32020 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC32020, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC32020 BINDING SITE, designated SEQ ID:11644, to the nucleotide sequence of GAM63 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:348.

[8948] Another function of GAM63 is therefore inhibition of MGC32020 (Accession NP_689479.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32020.

[8949] MGC33407 (Accession NP_848620.1) is another GAM63 target gene, herein designated TARGET GENE. MGC33407 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC33407, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33407 BINDING SITE, designated SEQ ID:16203, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8950] Another function of GAM63 is therefore inhibition of MGC33407 (Accession NP_848620.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33407.

[8951] MGC33884 (Accession NP_699161.1) is another GAM63 target gene, herein designated TARGET GENE. MGC33884

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC33884, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33884 BINDING SITE, designated SEQ ID:15982, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8952] Another function of GAM63 is therefore inhibition of MGC33884 (Accession NP_699161.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33884.

[8953] MGC34837 (Accession NP_689590.1) is another GAM63 target gene, herein designated TARGET GENE. MGC34837 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC34837, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34837 BINDING SITE, designated SEQ ID:10386, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.
